The natural advantages of Enville can hardly be overated, it owes so much to the picturesque character of its site; to the exceedingly fine timber of ordinary species, as well as to the beauty of those introduced because of their ornamental character. The landscape gardener might do his utmost, but unless his site was a favourable one he would yet fail to produce another Enville. The glorious vistas through which at places the surrounding country can be seen are very pleasing to the wanderer over the pleasure grounds, and fortunately there have been improvements made in this respect. Horse and Spanish Chestnuts, Beech, Limes, Planes, Oaks, and Yews are the trees one first observes, and many of the specimens are old, sound, and of noble size. Conifers generally are happy, especially the fine specimens of *Abies nobilis*, but several trees of *Araucaria imbricata* are less satisfactory.

The kitchen garden is nearly 6 acres in extent, and is made to produce as much as possible, for the demands of Enville are by no means small. There are plenty of fruit-trees, some inside the gardens, others in an orchard, a few among the latter past bearing specimen fruits, but useful, maybe, nevertheless.

### THE GLASS HOUSES.

In speaking briefly of the glass structures, mention must first be made of the noble conservatory; than which there are few finer existing. It was built upwards of forty years ago by Messrs. Gray & Ormson, of Chelsea, and was figured in the *Gardeners' Chronicle*, December 1, 1855. The dimensions given at the same time are as follows:—Length, 150 feet; width, 70 feet; height at apex of the two domes, 65 feet and 30 feet to top of the curved roofs. Though erected this considerable time, Mr. Green says it has required few repairs save glass, and he regards it as having been built in the most perfect manner. In the interior are large specimen plants of various cool species of plants, such as *Camellias*, which are planted in large beds; *Dicksonia antarctica*, *Azaleas*, *Genistas*, and others. We must not omit to commend the specimen white-flowered *Azalea*, trained bell-shaped; they are, probably, the best extant. *Abutilons* and other suitable plants clothe the pillars; and a stage running round the circumference is kept as well furnished with flowering and other greenhouse plants as the season renders practicable.

Figs are grown in fair quantity in a lean-to house, and include chiefly the older varieties, which are known to be free-cropping. There are plenty of vineries, and the crops of Grapes obtained are very satisfactory. Some old Vines in a low span-roofed house, apparently too aged for service, we are informed, still bear good crops of useful Grapes, and a new tenure of existence is to be granted them by training the rods down again to the front on the opposite side of the house. Pine culture, which is rapidly becoming a neglected industry in British gardens, is still pursued at Enville, and with success. Three nice fruits (Queen), weighing 14 lb., and cut at same time, affording good, if not, exceptional testimony. There are 2000 to 3000 Strawberry plants forced annually, and in the various fruit houses there is excellent accommodation for them. What a quantity of Peaches and Nectarines must be produced in the year from such a number of trees! Several smaller houses contain some, and then there is a case with span-top, about 365 feet long, 7 feet wide, and 14 feet high. Three of the four divisions into which this house is divided contain Peaches and

Nectarines, and embrace a good number of varieties, but Barrington Peach, and Nectarines Lord Napier, Humboldt, and Rivers' Early were mentioned as special favourites. The trees are in excellent condition, and bear good crops. In the remaining division, which is devoted to Cherries, we may mention a grand Cherry-tree (White Heart) which covers about 13 yards of the wall, and is one of the finest Cherry-trees we remember to have seen. A similar length of Peaches and Nectarines, with the addition of Apricots, is grown outside, with the protection of a glass coping at the top of the wall. At this season of the year, a good-sized house with low roof is devoted to Tea Roses in pots, of which there is a large stock. Afterwards, when these can be placed outside, they will be succeeded by a crop of Tomatos. Speaking of Tomatos, it may be useful to record the capital character of the variety Frogmore Selected, raised by Mr. O. Thomas, for planting at the foot of walls out-of-doors. Nothing could exceed the satisfaction the variety gave last season at Enville, and we have had other occasion to observe that it is excellent for this purpose. Warden Park Favourite has been given a trial, but Mr. Green thinks it may be discarded with advantage. Glenhurst Favourite has still a good reputation.

Of the principal houses reserved for the cultivation of plants, there are several good ones with span-roofs, in which we have seen grand batches of Adiantum and other Ferns, also greenhouse miscellaneous species, and a capital collection of Eucharis grandiflora. There are about one hundred 10 and 12-inch pots of these in the best of health. They have not been potted for four years, but are fed well with soot-water, and liquid-manure obtained from sheep-dung. They flower well twice each year. Orchids also in fair quantity are cultivated, but they are principally of those species most useful for the supply of cut blooms. There is, however, a good collection of Vandas and Aërides, well foliaged and in good health. Imported plants of Cattleya labiata autumnalis and Lælia autumnalis were seen, and a fine lot of established plants of Dendrobium nobile, Lælia anceps, miscellaneous Cyripediums, and two dozen grand specimens of Coelogyne cristata were noticeable. The stove contains a good collection of foliage plants useful for indoor decorative work, and in the summer season the pillars are graced with Aristolochias, Stephanotis, Gloriosa superba, &c. A house full of Azaleas reminds one again of the abundance of these useful-flowering plants found here. Chrysanthemums are grown in fairly large numbers, but for the needs of the place only, not for exhibition. There will soon be in bloom a number of white-flowering East Lothian Stocks in pots, being plants that were lifted from the open ground last autumn.

Enville used to be open free to the public on two days in each week. We are sorry to have to add, that four years ago the privilege was withdrawn, owing to the conduct of a small proportion of the numbers who annually visited the place. Her Ladyship, however, is still desirous that small and respectable parties, who wish to make a visit, should have that privilege, and by writing to the gardener beforehand, they may obtain a printed permit.

## FORESTRY.

### OUR TIMBER TREES.

(Continued from p. 168.)

A SPECIES coming rapidly into favour is the Douglas Fir. Up to the present, its use in plantations has been limited, owing to the comparatively high price at which it is sold, and if Larch-planters had experienced the same obstacle, we might have had fewer failures to record. In moderately-sheltered situations and fairly good and fresh soils, the Douglas Fir is likely to beat the record for fast growth, and the quality of its timber is also satisfactory. Compared with the Larch, however, it has one important drawback. The lower branches of the Larch are easily checked and killed off, and

exception when entirely isolated, it never becomes objectionably coarse and knotty. With the Douglas Fir this is otherwise, and nothing but close order will make it clean enough to please the timber-buyer, or render it useful at an early age. As we have no sufficiently rapid-growing nurse to mix with it, we must either plant thickly, or put up with coarse and inferior timber. To plant even a thousand to the acre would mean something like £5 per acre for plants alone if the smallest size were used, and this is rather higher than planters on a large scale care to go. Until young trees can be obtained more cheaply, it is hardly likely to become a common forest tree, although plentiful enough already as specimen trees. One parasitic disease (Botrytis Douglasii) has already made its appearance, attacking the young shoots; but whether this will ever prove a serious hindrance to its cultivation has yet to be seen.

As a rapid grower, Thuja gigantea is also frequently mentioned, and it has also the advantage of being easily propagated either from seed or cuttings. What sort of reception it is likely to receive in the timber market is another question. So far as we know, the timber of this species has never been imported into this country, and reports as to its quality are not so encouraging as those of the Douglas Fir.

When we come to compare the above or other introduced Conifer with our native hardwoods, it is apparent at once that the latter cannot put on the same bulk of timber in a given time as the former. But on the other hand, our hardwoods have a recognised position in the timber market which these introduced trees (the Larch excepted) have yet to acquire. Oak, Ash, Beech, and Elm of good quality always meet with a ready sale, and although their value has greatly depreciated during the last few years in correspondence with that of other commodities, we have no reason to believe that the demand has decreased to any extent. The natural supply of these timbers is nothing like so large as that of soft woods, nor is the land suitable for their growth of that class which is likely to remain uncultivated when once cleared. Unlike Pine timber, our home-grown hardwoods are still considered of better quality than imported wood of that class, in spite of the unfavourable conditions under which the former are grown. The most profitable and also the most rapid growing tree which our English climate can grow is probably the Ash, providing it gets the right sort of soil and situation. It seems doubtful economy, therefore, to plant Conifers whose timber is practically uncalled for, when indigenous species can be grown with less initial expense, and more certain pecuniary results. Even with such species as Scotch Pine and Beech, we have still to find their equal on tracts of poor soil and chalky hills, where the question is not so much what we ought, as what we can grow, and a live dog is always better than a dead lion. In ornamental plantations, anything so common as Beech or Oak would not, of course, be tolerated, but *de gustibus non disputandum est*. A. C. Forbes.

## PARIS.

### SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE.

THIS SOCIETY is about to form two new committees—one for Chrysanthemums, the other for Roses. At the *réunion* held on January 9, MM. Daval et fils, Versailles, staged a new *Odontoglossum*, which they have named O. Henrici, and for which they obtained a first-class award. This plant belongs to the O. Andersonianum group, it may be a natural hybrid or a variety of a type under which should be classed some plants which certain persons consider as distinct? This question remains to be answered. One thing is certain; that is, that this new *Odontoglossum* is a beautiful plant. It is remarkable for its flowers, with sepals and petals of a citron yellow, a little undulated, bordered with golden-yellow, and spotted with brown-yellow. At the same meeting, M. Troffant, of Versailles, staged a splendid new Cyripedium, for which a First-class Certificate of Merit was awarded him. This plant, named C. villosum Truffauti, is, according to the exhibitor, a natural hybrid of C. villosum × Boxalli, of which the parents shows traces. Two other hybrid Cyripediums were exhibited by M. Page, gardener to M. Lebandy (Robert), of Bougival. One, C. Nilssonii, is from C. Chantini × C. Boxalli; the second, C. Harrisii villosum, has, as parents, the plants whose names it bears. A first-class award was allotted to M. Page.

At the meeting on January 23, MM. Daval et fils showed *Cyripedium Harrisiano-superbum*, true, remarkable for its large and beautiful flowers; C. Charlesworthi, with a rose-coloured lip; and *Odontoglossum Rozzi*, a variety bearing violet spots. M. Truffaut staged *Selenipedium Schroderæ* var. splendens, brilliant in colouring. MM. Cappe et fils, nurserymen, of Vésinet, showed *Cyripedium hirsuto-villosum*, a splendid hybrid raised by them, differing from C. Germinyanum, although from the same parents. The plant flowered for the first time in 1890 in MM. Cappe's house. D. Bois.

## ERICA WILMOREANA.

THE present is a most fitting season for drawing attention to one of the finest of all the early spring-flowering Heaths. It is one of the earliest hybrids raised in this country, being first brought into notice about sixty years ago. Of its parentage I have no record, but as regards the value of the offspring there can be no question, whether for the greenhouse or conservatory. Under good cultivation it is a long-lived variety, being a most vigorous grower, so much so in fact, that it is sometimes shy to flower, unless carefully managed. It flowers best when in a measure pot-bound, but under these conditions much care is necessary that it does not suffer for want of water after the flower-buds are formed, otherwise there will be several blind or yellow ones formed, which will spoil the uniformity of the spikes. On the other hand, if watered to excess, there is a tendency on the part of this variety to make an adventitious growth late in autumn or during the winter. The remedy is plenty of light, a cool temperature, and close attention to watering. The foundation of a good crop of flowers is, as a matter of course, laid in the autumnal treatment prior to the plant being housed, a thorough ripening process being then most essential. After flowering, the spike-like shoots should be cut back hard, and young ones encouraged, otherwise the growths will soon be unmanageable, by reason of their length. Mildew is one of the worst enemies to fear, the dense growth favouring its development, but the usual remedy of sulphur will suffice. The colour of the flowers is deep pink, tipped white, and they last in good condition several weeks. Jas. Hudson. [See Knowles and Westcott, Floral Cabinet, ii. (1838), p. 115. Ed.]

## TREES AND SHRUBS.

### THUIA ORIENTALIS PENDULA.

AMONGST pendulous-habited Conifers, this is certainly one of the most distinct and attractive, while at the same time it is perhaps the most fastidious in its requirements. It is very apt, when growing under unfavourable conditions, to lose the lower branches, and in consequence it wears a naked and miserable appearance; but when seen in a healthy, thriving state, it must certainly be ranked as one of the most pleasing and ornamental of hardy Conifers. It differs much from the species, the flattened and freely-divided branches being replaced by large, pendulous, cord-like branchlets, with but few ramifications. Planted singly, and in suitable soil, it forms an ornamental, small-growing tree, of regular outline; while the long filiform branchlets impart a grace and elegance to the specimen for which it is justly remarkable.

The largest specimen I have seen is growing in deep, dampish, sandy soil, at Esher Place in Surrey, it being 16 feet high, 12 feet through, and with many

FIG. 27.—ERICA WILMOREANA X. (SEE P. 200.)

of the branchlets hanging gracefully downwards for 18 inches in length. From this specimen I have picked fruit similar in every respect to that of *T. orientalis*, thus proving conclusively that it is only a distinct and well-marked variety, and not a species as was at one time supposed. *A. D. Webster.*

#### CRATEGUS TANACETIFOLIA.

There is no reason why the tansy-leaved Thorn should not be classed with edible fruit trees. From its large yellow haws can be made a jelly, which resembles that made from the Guava (*Psidium Cattleianum*); and apart from this merit, not a very common one, considering the fewness of fruits suitable for the manufacture of jelly, the tree has characteristics deserving the attention of planters. For instance, it has large, yellow-coloured fruits, thus contrasting with those of the more common red haw. The foliage is very distinct, the hairs upon the leaves give them a greyish appearance, and the tree is of robust growth, with a fastigate habit, the main branches being upright and rigid. Other peculiarities are, the fruit is larger than that of other Thorns, excepting that of *C. mexicana* and *C. Aronia*, possesses prominent bractees, and is ribbed. The foliage is later in appearing in the spring than that of other species, with the exception of *C. orientalis*, from amongst which a profusion of large white flowers unfold late in the month of May, or early in June. The origin of the tree is somewhat doubtful, though it is supposed to come to us from the Levant. *William Earley.*

## THE WEEK'S WORK.

### THE ORCHID HOUSES.

By W. H. WHITE, *Barford, Dorking.*

**CYPRIPEDIUM MASTERSIANUM, ETC.**—The recently-imported plants of *C. Mastersianum* should be first potted in crocks only, and the leaves well washed before this is done. Water these crocks often enough to keep them always moist, as this will induce the plants to make roots. Not having had any experience in the cultivation of this handsome species, I can only advise cultivators who possess several plants to place them in the various warm-houses, and in different positions, carefully watching them and noting where they thrive best. When root-action is commencing, re-pot the plants into ordinary Orchid-compost. Plants that have their bottom leaves intact need not be repotted, but if the gardener have a suspicion that the sphagnum-moss is decaying, fresh healthy moss should be substituted for it. *Saccolabium ampullaceum*, *S. curvifolium*, *S. Hendersonianum*, *S. giganteum*, *S. zuttatum*, *S. retusum*, *S. violaceum*, *S. Blumei*, and *S. praeorsum* coming from the hottest tropical regions naturally require a high temperature. They do best in baskets of teak, for being of dwarf growth, there is little difficulty in placing them close to the light, a matter of great importance to their well-doing. Hung up, these plants are less liable to be reached by cockroaches, which do much injury to them by nibbling the points of the roots. All root disturbance should take place as soon as root action has begun.

**ANGRÆCUM SESQUIPEDALE AND OTHERS.**—This interesting plant always attracts attention when in bloom, on account of the remarkable character of its flowers, which are large, bold, and of ivory whiteness, and furnished with tail-like spurs exceeding 1 foot in length. Plants of *A. sesquipedale* which have finished flowering are pushing a number of young fleshy roots out of their stems, and any plant in need of more root-space, or the sphagnum-moss of renewal, should forthwith be attended to. If any specimen have lost its lower leaves, it may be lowered and repotted, and treated in all respects like *Asiides* (see previous Calendar). *A. sesquipedale* likes heat and moisture, and the East India-house forms a suitable place in which to grow it. It will thrive, however, in a warm part of the Cattleya-house. The roots like moisture rather than dryness, therefore when water is needed, let it be afforded in abundance, but avoid always keeping the sphagnum-moss wet, or the "spot" disease will speedily appear on the leaves. The singular *Angræcum pertusum* is another interesting plant, with small white flowers arranged symmetrically along the upper side of the spike, and owing

to this feature it is generally known as the "fish-bone" Orchid. It is not difficult to cultivate, if afforded similar treatment to that afforded to tropical species generally. *Angræcum distichum* deserves more general cultivation, but it is at present not generally known; all the same, it is well worthy of the attention of the amateur, especially if he have a fancy for the so-called botanical species. Its tiny flowers, of unusual whiteness and pleasant odour, are produced in profusion. *Angræcum distichum*, like its congeners, succeeds in the East Indian-house. Another small-flowered species is *A. odoratissimum*, which although not a showy Orchid, is well worth attention, if only for its perfume.

**THE INTERMEDIATE-HOUSE.**—The various *Miltonias*, as *spectabilis*, *Moreliana*, *Blunzi*, *Lubbersiana*, *Peetersiana*, and *virginialis*, have started to grow, and for those requiring more rooting space this is the best season for re-potting. These plants being of dwarf growth, shallow pans suit them best, and as extension in every direction is rapid, considerable root-space is required by them. Those which are bare in the centre may be divided, and have all diseased or useless pseudo-bulbs and dead roots cut away. The living thriving pieces may be made up again into neat compact specimens, and those which have but few roots should be secured with pegs stuck into the compost, or they will never do any good. *M. Regnelli*, *M. cuneata*, *M. Clowesii*, *M. stellata*, and *M. candida grandiflora* are stronger-growing, and should be accommodated in Orchid-pots, not, however, disturbing any which have well-advanced flower-spikes, the proper time for the operation being on re-commencement of growth. The whole of the *Miltonias* here mentioned succeed in fibrous peat of good quality, from which all the fine matter has been knocked out, using no sphagnum-moss whatever; but plenty of crocks to prevent souring of the peat, frequent waterings being required by the plant whilst growing.

### THE KITCHEN GARDEN.

By C. HERRIN, *Gardener, Droppore, Maidenhead.*

**HORSE-RADISH.**—Although often grown in some out-of-the-way part of the kitchen garden, and allowed to occupy the same ground for many years without re-planting or other cultural attention, it is a vegetable which, to obtain at its best, that is, with roots of half the size of a man's wrist, must be given good culture, and it should not be left year after year without being re-planted. If a fresh piece of ground which has been manured and thoroughly trenched can be spared, planting may take place shortly. When new ground for a bed is not to be had, the old bed should be trenched forthwith to a depth of 2 feet, a heavy dressing of well-rotted dung and any burnt refuse being dug into the land and well incorporated with it. In trenching it, let every particle of horse-radish root be gathered up, saving all the pieces that are large enough, and lay them in, in rows, on a north border for future use. Pieces suitable for making planting-sets should also be selected, those which are young, straight, and about 12 inches in length being preferred, and after all the lateral thongs and small roots are trimmed off, lay these also in some out-of-the-way border till wanted for planting. For this operation a good long dibber of either wood or iron with a tread is required for making the holes, which should not be less than 15 inches in depth, the top of the set when dropped in being 2 or 3 inches below the surface. A small quantity of soot and wood-ashes should be scattered over the bed, and then the surface raked over, so as to fill up the holes. The sets should be planted in rows 18 inches apart, and at 1 foot asunder in the rows. If the soil consists of rich, heavy loam, Horse-radish is better for being grown on low ridges, and the sets planted in a slanting direction just under the surface. The roots are easily dug up for use when planted in this way; and some of the best roots I have seen were thus grown in a new garden made on what had previously been a pasture.

**ROOT STORE.**—There should be no delay in placing seed Potatoes for outdoor planting on end in shallow boxes, the eyes being placed uppermost, special care being taken of the central or strongest sprouts, if sprouting has taken place. The tubers for consumption should be turned over occasionally, and cleared of all sprouts, otherwise deterioration will take place. Onion, Carrots, and other roots in store should be similarly treated, and decaying roots removed.

**CELERY.**—Celery required for use early in the autumn should now be sown in pans or boxes filled

with light rich soil, the seeds being very slightly covered. Place the seed-pans, &c., on a hot-bed, or in a warm house, where they should remain till germination takes place, and then be at once removed to a cooler place. A mild hot-bed should be made soon afterwards for pricking-out the seedlings upon, which last may be done when they are large enough to handle; or should some heads be required for early exhibition purposes, the required number may be put into small pots, grown on, and afterwards hardened-off by degrees in readiness for planting-out at the end of the month of May. Early Rose is one of the best varieties for sowing at this date.

**VARIOUS.**—A small sowing should be made in pans or boxes of Brussels Sprouts, Eclipse and Autumn Giant Cauliflowers, and of Cabbage. A small breadth of Potatoes may be planted on a sheltered border, which should be near to a south wall if possible, and where it will be easy to afford protection from frost. A sowing of Peas may be made, selecting a variety with wrinkled seed, such as Duke of Albany. Seeds of Broad Beans and Peas sown some time since in pots and on turves, should be brought out of the warm houses as soon as they are 1 inch above the soil, and placed in cold frames, keeping the lights rather close for a few days, and afterwards ventilating freely even removing the lights entirely in fine mild weather.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

**LABELLING FRUIT TREES.**—It is very important that the names of all newly-planted trees received from the nurseries should be properly written on durable permanent labels of lead, zinc, or earthenware, before the writing on the nursery tickets has become illegible. Whatever the kind of label used, let the wire tie which fastens it to the tree, be of sufficient length to form a ring 4 to 6 inches in diameter, and fix this round a side branch rather than the stem, the latter increasing more rapidly in girth than the former. For my part, I prefer to draw a plan of the garden, making small circles, each of which has in its centre a number, indicating the position of each tree, and on one side of the plan I place the numbers with the names of the varieties and kinds attached, so that the position and name of each tree is readily found.

**NEWLY-PLANTED FRUIT TREES AND BUSHES.**—Fruit trees which were planted on coming from the nursery, or transplanted during the past autumn, should now be pruned. Before commencing to prune a tree or bush, the gardener should determine the number and position of the branches to be left to form the basis of a well-proportioned head, either as standard, bush, pyramid, espalier, or cordon. In pruning standard trees and bushes, one of the chief points to be observed is to cut out all superfluous shoots, that is, those which, if retained, would prevent, in great measure, the sunlight getting to the inner parts of the crown or head when the leaf is on them. The laterals which are left should be shortened to a couple of buds each, and the main branches to about one-third of the length of the previous year's growth, the terminal bud being one which is on the outer side of the shoot, which points towards the direction in which it is wanted. Pyramids require their leading shoots to be shortened about one-third of the length of last year's growth, cutting them to a bud that is well placed for taking the lead, pruning back the main side-shoots into well-ripened wood, and always having an eye to the symmetrical aspect of the trees. Spurr-in closely all laterals, and if any of the branches show a tendency to grow upwards instead of horizontally, fasten them in the proper position to stakes driven into the soil. Espaliers, if horizontally trained, should have the upright leader cut back to a length of from 12 to 15 inches beyond the last pair of side-growth, close to the bud that is placed immediately above the pair, which will supply the next tier of branches. The lateral shoots should be pruned to a couple of buds, but the short starchy shoots of from 3 to 4 inches long, which are usually fruit-buds, or will eventually make such, should not be pruned. The side branches themselves will not require to be stopped, but extended till they have filled the space allotted to the tree, when they should be treated like the lateral shoots—that is, cut back to two buds annually. Cordons should have all the lateral growths spurred-in, and the leading shoot or shoots allowed to grow in length about 12 or 18 inches, according to the vigour of the cordon. It should be borne in mind that trees

making strong growth, whose wood is well ripened, should not be hard pruned like those of weakly growth. Wall trees, espaliers, and cordons, as soon as pruned, should be secured in their proper positions, the soil having settled itself by this time. If the trees and bushes were not mulched with stable-manure when planted, a mulch may now be given, and the spaces between the trees lightly dug over.

#### THE FLOWER GARDEN.

By HEDLEY WARREN, *Gardener, Aston Clinton, Tring.*

**GLADIOLUS.**—The beds in which these are to be planted should be prepared without delay. Well trench the soil, and add a good proportion of decayed manure; if obtainable, cow-manure should be preferred. The Gladioli delight in a rich well-drained soil, and a position unshaded by trees should be chosen. An open spot in the garden is the best, provided the plants are not exposed to rough winds. As a rule, the planting of the corms may be proceeded with any time from the beginning of March; but in some localities the soil may be too cold, in which case it is better to place the corms singly in 4 or 5-inch pots, and allow them to start gently in a frame or cool house—growing them on thus for a few weeks, before planting them outdoors. The corms require to be planted about one foot apart, and securely staked as growth advances. Beds of the Colvillei alba and the Lemoinei varieties, which were planted in the autumn or early winter months, should receive a good mulching of half-rotten manure if such has not been already applied.

**CLEMATIS, JACKMANI**, and other varieties, when planted in a bed, afford a fine display of richly-colored flowers during late summer and autumn. They are, however, not so much employed in the flower-garden as they might be. It is usual to peg the branches and stems down to the soil, or train them on pieces of wire stretched slightly above the ground, in which manner they succeed admirably. An excellent edging to a bed of Clematis is formed of *Dactylis glomerata*, or *Pelargonium* with silver variegated leaves, either of these contrasting well with the purple and other rich colours of the Clematis blooms.

**MIGNONETTE.**—For an early out-of-doors supply of flowers a sowing should now be made in 3-inch pots, this being a size very handy for turning out. A suitable compost in which to sow is made of loam two-thirds, leaf-mould one-third, and a small quantity of sand if the loam be tenacious; the drainage should be good. Having made the soil quite firm, and levelled the top, sow twelve seeds on each. Mignonette does not bear heat, and the seed should not come into a temperature exceeding 50° to 55°, and as soon as the seedlings are through the soil, afford plenty of ventilation; harden off by degrees preparatory to planting out in a somewhat sheltered position. Useful varieties are Mchet, Miles' Spiral, and Golden Gem, the last-named being very compact and fragrant, and a decided acquisition.

**PELARGONIUMS.**—Speaking generally, these plants should be propagated in the autumn, but losses will occur during the winter months which have to be made good at this season. In making the cuttings, each should be cut just below a joint, inserted singly into thumb-pots in light sandy soil, and made firm; the latter point deserves careful attention, to ensure rapid rooting. Place in a temperature of 60° to 70°, or plunge the cutting-pots in leaf-mould, coal-ashes, or Coconut fibre refuse over a gentle hot-bed, avoiding, however, much humidity in the pit or frame, or the cuttings will damp off badly.

**AGERATUMS.**—Cuttings may now be taken, which root freely enough whether cut just below a joint or not. Insert them in sandy soil in pots or boxes, and place in a warm-house. The most expeditious manner of striking cuttings of this plant is to insert them in ordinary saucers filled with sand and water, and place in a brisk bottom-heat or over the hot-water pipes in the propagating-house. Under this kind of treatment, the cuttings will frequently make roots in four days. They should be potted-off without much delay after becoming rooted. Seeds may also be sown in heat, for the production of plants by the end of the month of May.

**MESEMBRYANTHEMUM CORDIFOLIUM VARIETATUM.**—This is one of the most difficult bedding plants to propagate, unless great care be taken in preparing the cuttings, and with their treatment afterwards. The cuttings should not be bruised in the least, and a very sharp knife should be used, so that the cuts which should be made below a joint, may

be clean. The cuttings should be dibbled at about an inch apart into 5-inch pots, filled with a mixture consisting of two parts clean sand and one of sifted leaf-mould, with a thin surfacing of fine clean sand, well watered in with a fine sprayer, and the pots placed on a shelf in a house whose temperature does not fall below 65°, and where there is no drip. Shade the cuttings from bright sun, and afford no water, if the atmosphere of the house is moist, till after they are fairly well rooted, which should be in about fourteen days; pot them off singly into thumb-pots, keep them in a growing temperature, finally shifting them into 3 or 4 inch pots, and gradually hardening off in cold pits or frames.

**DAHLIA CUTTINGS.**—The tubers of any varieties required to be propagated may now be placed in heat for forming cuttings. Cover the tubers with a thin light soil, watering down amongst the roots with tepid water. When the growths are 3 to 4 inches long, take off the foremost as near to the root as possible, and insert them singly in thumb-pots in sandy soil and plunge in bottom-heat; or if more convenient the cuttings may be dibbled in Coconut fibre refuse in a propagating case, and when rooted pot off. It sometimes happens that the first cuttings from the old roots are hollow in the stem, these should be rejected, for they seldom root freely, the smaller cuttings are much to be preferred in every way.

**MISCELLANEOUS WORK.**—All outdoor work should be pushed on as rapidly as possible, and grass-walks, lawns, gravel-paths, and drives made neat and tidy. Should moss or other weeds have made their appearance on the two latter, they may be speedily destroyed by the use of one of the many advertised weed-killers. Herbaceous borders should receive attention either in the matter of re-arranging or the making good of any vacancies that may have occurred, as the case may require. A selection of plants may be made from a list given in a former Calendar.

#### FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

**FIG TREES PLANTED IN HOUSE.**—Where forcing was commenced early in the year, these trees will be starting well into growth, requiring attention in the matter of tying down or thinning out shoots where crowded. A moist atmosphere, by means of syringing twice a day, should be maintained, and the afternoon syringing should be done early enough to let the wood get dry before nightfall. If the border requires it, water should be applied, and slightly warmer than the temperature of the house. Weak liquid-manure may be afforded if the trees are weak in growth. The night temperature should vary from 55° to 60°, and rise during the day to 75° or 80° by sun-heat. Close the house in the afternoon with a warmth at 70°; when higher than this figure, a free circulation of air should be afforded.

**EARLIEST FORCED FIG TREES IN POTS.**—These plants should be supplied at regular intervals with weak, and warm liquid-manure, and if the drainage is what it should be, there will be no fear of supplying more than the plants can make use of. Syringe the trees morning and afternoon on fine days, and in other ways keep the atmosphere moist. All gross shoots should be stopped at the fifth or sixth leaf, interior shoots removed or thinned out, as well as all useless spray, so that the fruit-spurs and fruit may have the full benefit of air and light. If the pots are filled with roots, a top-dressing of stimulating material may be given. Strips of zinc, 3 or 4 inches in depth, placed round the rim of a pot, will allow of a good thickness of materials. The bottom-heat should stand steadily at 85°, the temperature of the air at 65° to 70° at night, according to the state of the weather, affording fresh air in small quantities on all favourable occasions, and closing early in the afternoon at 75° or 80° by sun heat. Thin the fruit as soon as it can be decided which are the more promising.

**EARLY PEACHES.**—Let these fruit trees be pushed on by closing the house early, no harm accruing to them by so doing during the prevailing mild open weather, and syringing them with tepid water at closing time. Do not use more fire-heat than is really necessary on cold nights. A temperature of 50° will suffice for the present, advancing 5° in mild weather. When the fruits set, partially thin the crop by removing those fruits which show at the back of the shoots and in clusters of twos or threes.

The succession-house should be treated as advised in an earlier calendar. Unpruned trees in late houses should be pruned, cleaned, and fastened to the trellis forthwith. Keep these trees cool for the present, with full ventilation afforded night and day. Water may be afforded at the root if there is any suspicion that the soil of the border is dry.

**PINERY.**—Plants which showed for fruit early last month will soon be in flower, and will then require a temperature of 70° at night, with a small amount of air by day when the internal heat reaches 80°. Shut up early and economise fuel thereby. Water carefully, examining every plant twice a week, and afford water only to those which really require any. Keep a moist air by wetting the walls, paths, &c., twice a day, but be sure that the moisture which condenses on the glass does not drop on to the crowns or fruits. A batch of plants for succession should now be afforded an increase of top and bottom heat, so as to induce them to flower next month. Give one good watering, enough to moisten the whole ball and no more, till the crown appears, and keep them rather dry if the plants are disposed to run to leaf.

#### PLANTS UNDER GLASS.

By JNO. MCINTYRE, *Gardener, Woodside, Darlington.*

**THE CONSERVATORY.**—This building may now be thoroughly overhauled, and the climbing plants therein pruned and regulated. If this work be well done, it will suffice for the next four months. As all kinds of plants thrive better in a clean house than in the opposite, and they are easier to keep clean, the wood-work, glass, and walls should be rendered quite clean, or be painted and white washed as may be required.

**CHRYSANTHEMUMS.**—The young stock of these plants will in most cases be rooted, and those which are rooted should be placed on a greenhouse shelf near the glass. Much depends in Chrysanthemum culture on a good beginning. I would advise gardeners to keep the cuttings for the next month or two as cool as possible, with as much ventilation afforded as is consistent with safety to the other inmates. In close houses the plants become drawn and weakly, and their constitution soon ruined. No re-potting will be needed before the cuttings have plenty of roots, and on the other hand they must not be allowed to starve by being kept in the pots after these are nearly filled with roots. For the first potting the compost should be of a light nature, and consist of equal quantities of good loam and leaf-mould, some river-sand—more or less according to the kind of loam used, with a sprinkling of wood-ashes. The potting should be firmly done by hand only. Much water should not be afforded until roots have pushed pretty freely into the new soil.

**BEONIAS.**—The tuberous varieties should now be shaken out of the soil in which they have been kept, re-potted into pots of two sizes smaller, and given a start in a temperature of 60°. Seedlings raised last autumn, and which were pricked-off into pans may now come into thumb-pots, and be started into freer growth. Begonia seed may now be sown to supply plants for late flowering. The seed-pans may be half filled with crocks, and over these place a compost consisting of peat and leaf-soil two parts, and one part silver-sand. There should be little or no covering of the seed with soil, although a sprinkling of sand is not injurious. Great care must be taken not to disturb the seed when watering the seed-pans, by using the finest of rose-cans, or sinking the pans to two-thirds their depth in a pailful of water. A shelf in a warm greenhouse is a suitable place for the seed-pans till the first rough leaf is made.

**ROSES IN POTS.**—These plants should now be pruned, and re-potted or top-dressed, as each may require. My practice is to re-pot and top-dress in alternate years. In re-potting and top-dressing, I would advise the use of strong loam three-quarters, one-quarter clean river-sand, with a fair sprinkling of Vine-manure. A Peach-case where the trees are on the move is a capital place for pushing on pot Roses, provided they are not shaded in any way.

**THE FLORA OF THE PARIS STREETS.**—A census of the plants found wild or growing spontaneously in the streets of Paris, shows that the number of such plants is not fewer than 209. In the courtyard of the Louvre (Place du Carrousel), forty-five species may be found. The banks of the river and the canals furnish the greater number.

## APPOINTMENTS FOR THE ENSUING WEEK.

## MEETINGS.

THURSDAY,	FEB. 20—	Linnean Society meet.
FRIDAY,	FEB. 21	{ Royal Gardeners' Orphan Fund, Annual Meeting at Anderson's Hotel.
SATURDAY,	FEB. 22—	Royal Botanic Society meet
SALES.		
MONDAY,	FEB. 17	{ Hollyhocks, Roses, Spiræas, Begonias, &c., at Protheroe & Morris' Rooms.
TUESDAY,	FEB. 18	{ Carnations, Calceolari, Herbaceous Plants, Roses, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	FEB. 19	{ Great sale of Japanese Lilies, Tubero- seas, Gladioli, Fœonies, Begonias, &c., at Protheroe & Morris' Rooms.
THURSDAY,	FEB. 20	{ Stove and Greenhouse Plants, hardy Border Plants, and Bulbs, &c., at Protheroe & Morris' Rooms.
FRIDAY,	FEB. 21	{ Hardy Perennials, Clematis, Amaryllis, Carnations, &c., at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39° 3'.

The Royal Horticultural Society.

THE proceedings at the annual meeting of the Royal Horticultural Society resulted in a triumphant vindication of the Council.

Nor is that surprising. The financial state is sound, the number of new Fellows increases steadily, Chiswick is in good condition, the Drill Hall meetings are well supported, and the Temple Show is increasingly successful, and the *Journal* is well conducted. All this, it must be remembered, is the direct result of the changes which were made in consequence of the exodus from South Kensington, and among those responsible for the present condition of affairs, none has taken a more prominent and useful part than the present Secretary. All these facts are obvious to the Fellows, and were properly enough enlarged upon by the President.

The other side of the shield was not shown, and though an amendment was proposed and seconded, it failed to attract the sympathies of the meeting. On such occasions as annual meetings, general principles are discussed rather than minor details of management. On this account, it was, we suspect, that the highly objectionable procedures in connection with Chiswick, and other matters which have caused so much feeling, were passed over entirely.

The provinces which claim, and rightly claim, a greater share in the benefits of the society will, for the present, have to be content with the appointment of two deputies to attend the show at Chester and that at York, though what the deputies are going to do is not apparent. This is an imitation of the plan which has been carried out in Paris for many years, and we suppose, therefore, has been found useful. The whole question of the relations between the provincial and the parent societies needs discussion. At present neither the head-centre nor the local bodies seem to have any ideas beyond flower-shows. We do not wish to disparage their usefulness, but we think the co-operation of metropolitan and local societies might be much more advantageously turned into other channels. The advancement of horticulture is the main point to be striven after; the gratification of the exhibitors and the recreation of the public are relatively subordinate matters. In the meantime it is a fair question to ask what advantages do the affiliated societies get now by their connection with the Royal Horticultural Society, and what they might get in the future? This is too large a subject to enter upon now. It must

suffice to point out that in an educational direction alone much might be done.

The election of members of Council is an affair which the Fellows should take into their own hands, but almost invariably they neglect to do so; and the consequence is, that now there is not a single representative gardener on the Council. Everyone forgets that the proposals for new members of Council should be sent in before January 10! It may be suggested that the Council should, each year, about one month before the proper time remind the Fellows of their duties and of the date when they should be executed.

In moving an amendment to the adoption of the Report, Mr. SMEE abandoned the formidable battery of questions which he had proposed to ask at an earlier period, and which would at least have thrown some light on the discreditable proceedings at Chiswick, and confined himself to a legal point—the right of the Society to elect a Life-Fellow and make payment to him.

The meeting was in no mood to listen to legal subtleties, and was no more judicial than such assemblages usually are. Many will remember that a cognate difficulty arose in the case of Mr. D. T. FISH some years ago. The point should obviously be settled, in view of preventing the indignities which may, as was the case with Mr. FISH, be some day cast upon the very men it was desired specially to honour, and which it is conceivable might affect the future payment of Mr. BARRON'S pension.

Still less inclined was the meeting to sympathise with the questions put by Mr. BARR. These were so obviously personal, that it is much to be regretted they were ever put.

Mr. BARR'S ill-judged catechism proved an opportunity for Baron SCHRODER to make an eloquent vindication of the Council in general, and of Mr. WILKS in particular. He was followed in a similar strain by Mr. VEITCH, so that the proceedings ended with a sort of ovation for the Council of the Society and its officers.

Arbor Day in Japan.

WHAT this anniversary signifies in the United States of America has long been understood by our readers, and it will certainly please them to know that the idea is being taken up in Japan by both official and non-official persons; in fact, it is very likely that the first celebration of Arbor Day will take place on the 11th proximo, the anniversary of the accession of the first Emperor of Japan; or on April 11, the anniversary of the said monarch's death. The former would certainly be the more auspicious occasion. But it is proposed to make of Arbor Day in Japan a more important affair than, as we understand, it is made in the United States. All the scholastic authorities in Japan have taken to the idea, and it is proposed, through its adoption, to interest all the boys and girls of Japan in the study of botany—the State working out a profit in the establishment of forests wherever the growth of timber is now required. It is scarcely necessary to say now that there is no study in the whole curriculum equal to that of botany, and the Japanese authorities have issued an extended "minute" full of wise provisions or suggestions for the guidance of heads of schools, all bearing directly on the planting, growing, and bringing to maturity, of flowering shrubs and plants, and of forest trees—Oaks, Pines, &c. It would be useless here to do more than state that the "minutes" of the State official seem to cover the whole ground of a good course of botanical instruction; but the necessity for its proving a paying concern is kept prominently

before "all whom it may concern." The United States Consul, who was privileged to introduce the subject of Arbor Day to the Japanese Sub-Secretary of Finance, must surely long since have been congratulated by his chief, Mr. J. S. MORTON, on the success of his effort, as he deserves to be by all lovers of botany throughout the scientific world.

**DASYLIRION ACROTRICHUM** (see Supplementary Illustration).—Of this fine decorative plant, a specimen stands in the foreground of our view of the conservatory at Corbie, Newton Stewart, N.B. *Dasylirion* belong to the natural order Liliaceæ, and *D. acrotrichum* is a native of Mexico. It is rarely met with in gardens, notwithstanding the ease with which it may be cultivated in the greenhouse, and its graceful habit; and it is still more rarely observed in bloom. The specimen shown in the view possessed a shaft and panicle of flowers of 8 feet in height, being doubtless a remarkably handsome one. The flowers are white and the panicle dense, cylindrical, and usually measuring 4 to 5 feet in length. The leaves are linear, 3 to 4 feet long, and the trunk is simple and of very slow growth.

**LINNEAN SOCIETY.**—On the occasion of the meeting held on Thursday, February 6, Mr. C. E. CLARKE, F.R.S., President, in the chair, the Rev. E. WOODRUFFE-PEACOCK and Mr. W. COLE were admitted, and Messrs. J. BACKHOUSE, GILBERT CHRISTY, and J. RICHARDS were elected Fellows of the Society. Sir W. H. FLOWER, K.C.B., F.R.S., presented to the Society, on behalf of the subscribers, a portrait of Mr. WILLIAM CARRUTHERS, F.R.S., Ex-President of the Linnean Society, painted by Mr. J. HAY. On the motion of Mr. J. G. BAKER, F.R.S., it was resolved *nem. con.* that the portrait be accepted, and that a cordial vote of thanks to the donors be recorded. On behalf of Mr. B. G. COBURN, Dr. D. H. SCOTT, F.L.S., gave the substance of a paper on "Polystelic Roots of certain Palms." He remarked that, with scarcely any exception, the roots show one normal vascular bundle or stele. The author, utilising material from Caylor, found that in *Areca catechu*, Linn., *Cocos nucifera*, Linn., and a species of *Versaffeltia*, the young roots agree with this condition; but on examining older and thicker portions of the same roots, he found many steles present. After discussing the origin of this, the author considered the change to be primary, not secondary, and suggested that these roots might serve as props to the stem. The paper was criticised by Mr. GEORGE MURRAY and Professor TBAIL, Dr. SCOTT replying to objections.

— An evening meeting will be held on Thursday, February 20, 1896, at 8 P.M., when the following paper will be read:—"On Discoveries Resulting from the Division of a *Prothallus* of a Variety of *Scolopendrium vulgare*." By Mr. E. J. LOWE, F.R.S., &c.

**CYPRIPEDIUMS AT KEW.**—"The editorial note on the collection of cultivated *Cypripediums* at Kew, published last week under the heading of "Hybrids" (p. 175) is both misleading and untrue. There are sixty species of *Cypripedium* (including *Selenipedium*) in the collection, and, except only the rare *C. Fairrieanum*, these are all that are known to be in cultivation. Of the hundreds of hybrids now known (in the list published in the *Gardeners' Chronicle* last year, February 16, p. 199, there are 522 enumerated), only thirty-two are represented at Kew. During the winter, the more delicate species are kept in the small private houses, where the conditions are more suitable than in the large houses to which the public are admitted; but anyone specially interested is permitted to see the plants in the private houses. When the note in question was written, there were thirty-six species and twenty-four hybrids on exhibition in the two public Orchid-houses, and of these fourteen species and seven hybrids were in flower. Every plant has a label indicating whether it is a species or a hybrid. It is difficult to believe that anyone acquainted with these

A FLOWERING SPECIMEN OF *DASYLIRION ACROTICHUM*, IN THE CONSERVATORY AT CORSEBIE,  
NEWTON STEWART, N.B.

plants could, after actually inspecting the collection at Kew, arrive at the conclusion that hybrids predominated there, and that 'pure species were relatively very few.' *W. T. Threlson Dyer.* [We are glad to have the opportunity of publishing this note, as it is sufficient evidence that the original species, which are in danger of being lost elsewhere, are well cared for at Kew. Our figures and memoranda differ from those above cited, but as we visited the collection for a specific purpose, though of necessity hastily, it is more than likely we overlooked several species, and hence arrived at the conclusion that hybrids were predominant. Ed.]

**KEW GUILD.**—The annual general meeting of the Kew Guild will be held in the Gymnasium, near Kew Gardens Railway Station, on Thursday evening, February 27, at half-past seven.

**SOCIETY OF ARTS**—A meeting of the Applied Arts Section of the Society of Arts was held recently at the Society's Rooms, John Street, Adelphi, when Mr. F. INIGO THOMAS read a paper on "The Garden in Relation to the House," and which is reported in full in the *Journal of the Society.* Mr. T. G. JACKSON presided. Mr. THOMAS said he thought that as a nation we were beginning once more to realise the charm of a formal garden. We were commencing to infuse a breath of life into some of our buildings, and it was natural that the growth of interest in the direction of architecture should be accompanied by a wish to give the buildings some proper and dignified setting. Giving a history of garden architecture of old, Mr. THOMAS pointed out that old gardens were divided into several departments, and each of these bore a character distinctly its own. Passing on through the development of the pleasure-grounds of old, he suggested that the period of greatest activity might be placed in the reign of WILLIAM and MARY. Following a description of some Italian gardens, Mr. THOMAS proceeded to give his idea of how a garden should be made in these days a proper adjunct to the house. It was well, he said, in choosing a site, to depend more upon the masses of foliage which always existed than on what was proposed to be planted. But the difficulty was, that the idea existed that a different hand was required for the grounds to that which designed the house, and further that it was time enough to consider the grounds when the house was finished. He contended that if an architect had such a limited experience of country life that he could not be entrusted with the grounds, he certainly would not be competent to design a living home in the country; and that to place the whole of the designing in the hands of one individual was the only means likely to result in harmony. The paper was illustrated by numerous lantern-slides, showing the various types of gardens mentioned.

**THE GARDENERS' ORPHAN FUND**—We are glad to learn that His Grace the Duke of BEDFORD has accepted the Presidency of this Institution in the room of the late Sir JULIAN GOLDSMID.

**FLOWER SHOW AT CAIRO.**—On the 21st of January, the Cairo Horticultural Society held an exhibition in the Eshkekeysh Gardens. The Khedive was the Patron and opener of the exhibition, which was well supported by the principal residents in and by visitors to Cairo. It was, altogether, a complete success, for which great credit is due to Mr. WILFRID CAREY, the Honorary Secretary of the Society. The exhibition was divided into two sections: one devoted to flowering plants; plants grouped according to the exhibitors' taste; plants with decorative foliage; bouquets; table decorations, and cut flowers. The second section contained but two classes: for fruit and vegetables respectively. The show was the first of its kind held in Cairo, and therefore, somewhat of an experiment. All concerned with the management of it are to be congratulated upon the enterprise which led them to embark upon the scheme, and the great success which rewarded their efforts.

**HORTICULTURE AT THE INDUSTRIAL SCHOOL, FELTHAM, MIDDLESEX.**—The London County Council having decided to afford the boys at Feltham

School instruction in horticulture, combined with practice, have appointed to the post of lecturer and instructor in the art of gardening Mr. A. McMILLAN, for a long term of years head gardener to Lady BATEMAN, Oakley Park, Scole, Norfolk.

**STOCK-TAKING, JANUARY.**—However sanguine many might have been after considering the balance-sheet of the trade for 1895, few would have cared to predict so favourable an opening of the account for 1896 as has been furnished by the trade returns for January, issued a few days since. The figures are simply astonishing. The imports for the month are valued at £38,473,856—or an increase over the corresponding period last year of £1,730,375; the exports foot up at £21,127,168—an increase of £2,902,932 over the same period in 1895. All this reads "straightforward hard work, and plenty of it." Here are our usual extracts from the 'summary' table of imports for the past month:—

IMPORTS.	1895.	1896.	Difference.
Total value of imports	£ 36,743,431	£ 38,473,856	+1,730,375
(A.) Articles of food and drink—duty free ... ..	11,872,133	12,512,808	+640,675
(B.) Articles of food and drink—dutiable	1,950,705	1,894,900	-57,805
Raw materials for textile manufactures ... ..	9,825,233	9,031,186	-794,047
Raw materials for sundry industries and manufactures ...	2,693,577	3,189,712	+496,135
(A.) Miscellaneous articles ... ..	1,308,847	1,258,115	-50,732
(B.) Parcel Post ... ..	128,784	122,636	-6,148

In provisions there is a marked increase, and in butter. So marked is the increased import that the entries are now divided into colonies; of course, European imports still hold front rank. Tobacco has increased—always a good sign; and though Wheat has gone down, flour and other cereals are greatly in excess of previous records. By-the-way, the price of English Wheat is now 25 per cent. in excess of what it was in 1894. Raw materials have gone up nearly half a million sterling; timber is better by some £170,000; and manufactured articles of various kinds are considerably greater than is on the record for the same period last year—silk goods being notably greatly in excess. But it is useless to proceed further in this direction, and we turn to the imports of fruits, roots, and vegetables—always an instructive item:—

IMPORTS.	1895.	1896.	Difference.
Fruits, raw—			
Apples ... .. bush	487,339	293,163	-194,176
Cherries ... .. "	—	—	—
Plums ... .. "	72	210	+138
Pears ... .. "	3,261	834	-2,427
Grapes ... .. "	733	1,589	+856
Unenumerated ... ..	31,751	47,316	+15,565
Onions ... .. "	461,683	697,936	+236,253
Potatoes ... .. cwt.	112,795	41,672	-71,123
Vegetables, raw, unenumerated ... .. value	250,652	58,347	-192,305

It may not be out of place here to notice the complaint of an old correspondent, who says:—"For some years I have been trying to get the authorities in Whitehall to record in the Trade Returns the names and values of the vegetables imported into this country from abroad; this for the benefit of agriculturists and market gardeners at home—in vain! My last application was made in good time for the consideration of the committee. Perhaps some one else may be more successful." It has just occurred to us that, as the Russians are now taking, or about to take, to growing their own Tea, a new field for enterprising Birmese, with some English capital, has been found in some recently explored parts of that far-away land. The wild plant has been found in great luxuriance—proof in favour of the cultivated article.

**"SUITES AU PRODOMUS."**—Botanists and horticulturists will be pleased to hear that the ninth volume of this work is about to be published. It is devoted to the Order Bromeliaceæ, and has been prepared by Dr. C. Mez, of the Breilan University. It will comprise a summary of the researches of BRONGNIART, E. MORBEN, WILKOMM, BAKER, and others, together with the enumeration of the many species discovered since the publication of the works of those authors. About 1000 species are described, of which 239 are in cultivation. The book is likely to be of importance not only to botanists, but also to cultivators.

**JASMINE FRUITS.**—Mr. A. BUTCHER, of Welling, Kent, sends us ripe berries of the common Jasmine, with the information that this is the second time within three years that it has fruited in that locality. Considering the native country of the species, its fruiting here is a noteworthy occurrence.

**CERCLE HORTICOLE VAN HOUTTE.**—The Cercle Horticole Van Houtte, of Ledeberg, near Ghent, has arranged to hold from April 12 to 19, its second Grands Exposition Générale d'Horticulture, under the patronage of His Majesty the King of the BELGIANS. The programme mentions nineteen sections, and 397 classes; the awards are numerous and handsome. A special building will be prepared in the public square at Ledeberg. The engagements already received seem to promise that the exhibition will be a success. The attention of foreigners is directed to the classes devoted to new plants and to Orchid hybrids.

**THE LEEDS PAXTON SOCIETY.**—This virile society, of which the honorary secretary is Mr. J. CAMPBELL, gardener, Methley Park, Leeds, will hold their eighth annual Chrysanthemum Show on Tuesday and Wednesday, Nov. 10 and 11 next.

**EALING GARDENERS' ASSOCIATION.**—At the usual weekly meeting, held on the 4th inst., a good method of instituting a discussion on gardening topics was adopted. A number of questions were written on paper, collected, put into a hat, and the names of those persons who were willing to speak into another hat. These were shaken up, the hon. secretary, Mr. W. ROBERTS, drawing a question-billet, and Mr. C. B. GREEN, who presided on this occasion, one of the names, then calling upon the person indicated to open the discussion. The first question drawn was from the chairman of the Society, Mr. S. A. SEWELL, who was anxious to know as to the trees upon which the Mistletoe was known to grow? Mr. HARDING, in reply, stated that he had seen such growing on the Apple and the Oak; whilst Mr. COOPER gave in addition to these, the White Thorn and Lime. His was confirmed in this by Mr. SIMPSON. Mr. FROST had seen it growing on the Poplar. Mr. CHAMMAN on the Crabtree, Mr. STYLES on the Elm, Mr. COX on the Acacia, Mr. CHANDLER on the Wych Elm and Abele; whilst Mr. W. ROBERTS named a place in Hertfordshire where it grew, not only on the Sycamore and Maple, but on the Gooseberry bushes as well! The next question—"Is it desirable to root-prune Apple trees?"—elicited a variety of opinions. Mr. COOPER answered in the affirmative, with certain reservations. Messrs. HOLLOWAY, SIMPSON, and others, remarked that much depended upon the nature of the "stock" on which the Apple was grafted, the soil, and other matters. Several members, however, bore practical testimony to the beneficial results of root-pruning on trees, which had previously borne little or no fruit. Regarding the question of cocoanut-fore refuse being better than leaf-soil for propagating purposes, various opinions were expressed. Mr. HOLLOWAY, who opened the discussion on this question, was in favour of leaf-soil; Messrs. SIMPSON and CHANDLER stating that they mixed the fibre, when they used it, with suitable soil. Other subjects dealt with, and which raised useful and interesting discussions, were "the best means to stop Vines from bleeding," and "the best way to raise *Grevillea robusta*."

**MR. A. OUTRAM.**—We learn from Mr. OUTRAM, now in the service of Messrs. SUTTON, of Reading, as traveller, that he sails on Saturday, 15th inst., in the *Campania* for the United States.

**FLOWERS IN SCILLY.**—Owing to the unusually mild weather and the high temperature of the last two months, the flower and early vegetable traffic is expected to be the largest ever known. In consequence of the new night service arranged by the Great Western and London & North-Western Railways, in connection with the up London Mail from Penzance, flowers despatched from Scilly in the morning arrive in Edinburgh and Glasgow soon after noon next day. It is expected that vans will run from stations in Cornwall by the Severn Tunnel route to all the great towns in the Midland and Northern districts without any transfer at Bristol. The arrangements made by the railway companies for perishable traffic, in quick transit and early delivery, are much improved this season. *The Western Mercury*.

**READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—That the interest in the Chrysanthemum is still increasing was testified by the large attendance of members at the fortnightly meeting of this association, held in the Abbey Hall, to hear a paper on Chrysanthemums by Mr. W. H. LEES, gardener at Trent Park, New Barnet. After the formal business had been transacted, the President, Mr. A. W. SUTTON, said that Mr. LEES needed no introduction from him, as he was so well known to all present, but it was exceedingly kind of him to come and give them his experience in the culture of the Chrysanthemum. Mr. LEES gave a very interesting paper on the production of blooms for exhibition. The lecturer dwelt briefly with propagation, soil, potting, spring and summer quarters; watering, dressings, cutting down, stopping, feeding, insects, diseases, housing, &c., were all ably dealt with. Many questions were asked, and an interesting discussion ensued. Flowers were staged by Messrs. SUTTON of Cyclamens and Primulas; whilst Mr. TOWNSEND, gardener to Sir WILLIAM FARRER, Sandhurst Lodge, Wellington College, brought an interesting collection of Hellebores, numbering twenty-five varieties. The thanks of the meeting were accorded to Mr. LEES for his lecture, and to Messrs. SUTTON & SONS, and to Sir WILLIAM FARRER.

**ESSEX COUNTY SCHOOL OF HORTICULTURE.**—On Saturday, February 8, the students attending the above school, accompanied by the staff lecturers, inspected the indoor department of Messrs. SALTMARSH & SON'S Nursery, Chelmsford. They were heartily welcomed by the manager (Mr. SHERMAN), and taken to the various houses. Special interest attached to the visit to the propagating-pits, and the students eagerly availed themselves of the opportunity thus afforded of becoming conversant with the propagator's art. The forcing-pits afforded some useful information, as did the collections of stove and greenhouse plants.

**THE SURVEYORS' INSTITUTION.**—At the general meeting, held on Monday, February 3, 1896, a paper was read by Mr. R. F. COLAM (Associate), entitled "An Improved Method of Settling Disputes as to Rights of Way." A discussion followed, and was concluded, and a vote of thanks was unanimously passed to Mr. COLAM for his paper. The next ordinary general meeting will be held on Monday, February 17, 1896, when a paper will be read by Mr. A. A. HUDSON (Associate), entitled "Conditions of Building Contracts." The chair will be taken at 8 o'clock. It has been decided this year to hold the annual dinner on Wednesday, March 18, at the Whitehall Rooms, Hôtel Métropole.

**WHOLESALE FRUIT AND POTATO SALESMEN AND GROWERS' BENEVOLENT ASSOCIATION.**—We understand that Mr. GEORGE MONSO, of Covent Garden, has consented to preside at the annual Festival Dinner in aid of the funds of the Wholesale Fruit and Potato Salesmen and Growers' Benevolent Association, to be held on March 10, at the Holborn Restaurant.

**NATIONAL CHRYSANTHEMUM SOCIETY.**—The honorary secretary informs us that the annual general meeting of the members of the above Society will take place at Anderton's Hotel, Fleet Street, E.C., on Monday, February 24 next, at 7 o'clock in the evening.

**PUBLICATIONS RECEIVED.**—We have received the following Exchange Lists of Seeds.—*Liste des Graines Recoltées par le Jardin Alpin d'Acclimatation* (Geneva), H. COSSEYON, Janvier, 1896.—*Delectus Seminum quæ Hortus Botanicus Universitatis Rheno-Trajectinae* (Utrecht)—*Index Seminum in Hortis Musei Parisiensis* (Paris).—*Seed List from the Botanic Garden of the University of Pennsylvania*. Also the following publications:—*Proceedings of the Seventh Annual Meeting of the Association of Economic Entomologists*. Bulletin No. 2, U. S. Department of Agriculture. A publication treating of various injurious insects, and how to cope with them.—*Fourth Annual Report of the Women's Branch of the Horticultural College, Swanley, Kent.*—*The Improvement of Unproductive Black Soils*, by H. A. HUSTON, forming Bulletin No. 57 (for November, 1895), from Purdue University Agricultural Experiment Station. This pamphlet is written to prove how, by efficient drainage of a special kind, unproductive land can be rendered fertile. Bulletin No. 94, from the New York Agricultural Experiment Station (October, 1895). This consists of a valuable treatise on the Composition and Use of Fertilisers and of Science applied to Feeding-plants. The chemical compositions and properties of various manures are considered; and, in addition to information as to their right use, there are tables showing at a glance their respective constituents and the quantities necessary to dress certain lands bearing particular crops.—U. S. Department of Agriculture, Division of Entomology (Washington), *The Honey-bee; A Manual of Instruction in Apiculture*, by FRANK BENTON, M.S. A useful pamphlet, devoted to bee-keeping on an extended scale, and illustrated particularly clearly and well.—*Programme de la 162<sup>e</sup> Exposition Horticole qui aura lieu du 15 au Novembre 17, 1896*. Chrysanthèmes, Plantes Ornementales et Orchidées (Société Royale d'Agriculture et de Botanique de Gand). This should prove a useful guide to intending exhibitors at Ghent; in addition to a list of awards offered, it includes hints on the particular classes of plants expected by the judges, and the rules according to which the exhibition will be governed.—*Nature Notes* for February.—*Chapman's Magazine*.—*English Illustrated Magazine*, February.—*Agricultural Gazette*.—*Temporary Pastures: the Cheapest Method of dealing with Unprofitable Arable Land* (CASTEN'S, 237 and 238, High Holborn, London).

### NOTICES OF BOOKS.

#### BOTANY OF YAKUTAT BAY, ALASKA.

THE Washington Department of Agriculture in the Division of Botany has just issued another contribution from the *United States National Herbarium*, vol. iii., No. 6. This is an account of the Botany of Yakutat Bay, Alaska, by F. VERNON COVILLE. The catalogue consists of 137 species and varieties of vascular plants, and 27 species of cellular plants.

The specimens collected undoubtedly represent nearly all the species of vascular plants that occur in the area traversed, but circumstances prevented, for the most part, the collection of the cellular cryptogams.

Yakutat Bay is an interesting point in the classification of the zonal plant areas of the Pacific Coast, for at this place the dense coastal forest characteristic of the coast-mountains of British Columbia and Southern Alaska is broken by the occurrence of a series of glaciers which here come down to the very beach, counteracting the influence of the warm ocean currents and driving the timber-line backward into the sea. West of these points the Coniferous timber of the coast region ceases.

The transition ground of such a change from forest to perpetual snow and ice is full of interest. Two zones are clearly represented in the flora of the Yakutat Bay region, one extending from the sea up to the timber-line, the other from timber-line to the lower limit of perpetual snow. The conspicuous floral features of these zones are described in the field report embodied in the contribution.

#### THE ORCHID HYBRIDISTS' HANDBOOK.\*

Quickly exceeding each other come publications more or less pretentious, enumerating the hybrid Orchids and their parentages. The compilation being merely a matter of patience, offers a temptation to rush into print. Each issue may be regarded as a testimonial to the usefulness of the horticultural press, which supplies the matter of the original writers, from whence so many call the material for the work which is to bear their name. But such works are useful, inasmuch as they bring together all the available records, and thus form handy references until the lapse of time and the rapid production of new hybrids place them out of date. As a simple Handbook, enumerating the hybrids raised up to the present time, and their parentages, that under notice, compiled by Mr. A. E. HOPKINSON, appears to be one of the best. No intricate classification or new arrangement is attempted; and, consequently, once a person grasps the very plain plan of the work, it is easy for him to find that which he desires to see, provided it appeared not later than 1894. But seeing that we are now well into the second year of hybrids since the newest enumerated in the *Handbook*, the list will soon be superseded. Why such a simple matter as a catalogue of the kind should bear date of publication 1896, and yet stop at 1894, it is difficult to understand. There are a few pages of "Hints to Amateurs on Hybridisation," which contain nothing new or particularly useful on the subject, and the poor quality of the few illustrations does not help the work much. But as we said before, it is useful so far as it goes. As the compiler states that the printer's errors, which are rather numerous, are to be corrected before the *Handbook* is issued to the public, it would not be fair to comment on them now.

#### THE STRUCTURE AND DEVELOPMENT OF MOSSES AND FERNS. By D. H. CAMPBELL, Ph.D. (Macmillan & Co.)

THE object of this work is to gather together into one whole the mass of facts and observations which have accumulated of late years concerning the anatomy and life-history of mosses and Ferns. Hofmeister's researches, dating back more than thirty years, furnished a clue, which has eagerly been pursued, and which has led to a much clearer idea of the relationships of mosses, Hepaticas, Ferns, Lycopods, and Equisetums, than before existed. More than that, the investigations have, in a measure, bridged over the gap between Conifers and the higher Cryptogams, by linking the observations of Robert Brown on the corpuscula of Conifers, to those of Hofmeister and many other subsequent investigators, of the embryology of Cryptogams.

Among modern workers in this attractive field, Dr. Douglas Campbell, an American botanist, stands out prominently; and the present summary of his own researches, and those of Treub, Bower, and others, will be warmly welcomed. These researches

\* *The Orchid Hybridists' Handbook, with Hints to Amateurs on Hybridisation*, by A. E. Hopkinson. (Liverpool: Blake & Mackenzie, 1896.)

are of the greatest value for genealogical purposes, but, at present, they are not available for practical use. The distinction between Eusporangiate Ferns, whose sporangia originate from a group of cells, and Leptosporangiate Ferns, whose sporangia are the result of the development of a single cell, is one of no advantage to a practical botanist who has the developed plant to deal with, still less is it of benefit to the cultivator; nevertheless, this may only be a question of time. If the distinctions named be really valid, no doubt other co-relations will be found which will serve the purposes of the practical man. Everyone recognises a dicotyledon when he sees it, but comparatively few see, or can ever hope to see, the two cotyledons in every case.

The alternation of generations is a marked feature in these plants; the leafy stage, so to call it, is often very different from the fruiting stage. But recognising this, it is still open to doubt whether some of our modern morphologists do not push matters to an extreme when they repudiate any homological relation between the products of the two stages. The marked tendency to develop buds from any part of the surface, whether of gametophyte (prothallus), or of sporophyte, and the frequent occurrence of apogamy, seem to show a closer relation than is sometimes admitted between the two stages of growth. Dr. Campbell's book is clearly written, well illustrated, is provided with an adequate bibliography, and a copious index, so that it will take its place at once as a standard classic, and will, we think, retain that position for no inconsiderable period.

#### MALADIES DES PLANTES AGRICOLES CAUSÉES PAR DES PARASITES VÉGÉTAUX. Par Ed. Prillieux, tome I. (Paris: Firmin, Didot & Co., 56, Rue Jacob.)

This is a valuable treatise on the diseases of cultivated agricultural plants caused by various fungi. M. Prillieux has devoted special attention to this subject ever since, in 1876, his first appointment to the National Agronomical Institute in Paris. We have been till lately so accustomed to get our information from German sources, that it is an agreeable change to derive it from another quarter, and one more characterised by terseness and lucidity of expression than are as a rule the works of our Teutonic kinsfolk. Within the last quarter of a century, moreover, much has been done by our own investigators and by those in the United States, and now that the County Councils are establishing laboratories, we cannot doubt that so substantial an advance in home-grown knowledge will take place as to render our obligations to other nations less than they now are. In the meantime, let us be grateful to those who, like M. Prillieux in the volume before us, deals with the subject magisterially and practically. We observe that the Tomato disease, which is now so common in this country, and which consists in the rotting of the fruit in concentric lines spreading around the base of the style in the first instance, and gradually involving the whole fruit from above downwards, is attributed to a bacillus, the disease having, according to M. Prillieux, been induced by inoculation of the young fruit.

### BELGIUM.

#### GHEENT HORTICULTURAL MEETING.

THE February meeting was coincident with the General Assembly and the banquet of the Chambre Syndicale des Horticulteurs Belges, and was particularly interesting. Among the many fine Orchids shown were good collections from the well-known growers M. J. Hye Leyson and M. A. Van Imshoort.

Among M. Hye's Orchids, was *Odontoglossum crispum* Davivierianum, admired last year, and now seen again with a very fine truss of eleven magnificent flowers, remarkable for the different colours of the spots on the sepals and petals; the former are a brown-red, the latter purplish-red. This distinct variety won a Certificate of Merit *par acclamation*.

A similar award was allotted for *Cypripedium* × *Madame Jules Hye* (*C. tonsum* × *Spicerianum*). This new hybrid is distinct in the robustness and vigour of the whole plant, characteristics which are particularly noticeable in the two large, well-coloured flowers, rounded in form, like those of a good *Odontoglossum crispum*; the standard, which is 2½ inches wide, shows the influence of *Spicerianum* (the variety chosen for hybridisation, and which we know is most distinct), but it is redder, and the central band is of exceptional width; the lower sepal is as remarkable as the upper one of most *Cypripediums*, it being a reduced copy of the upper one; the petals show the brown shade of *C. tonsum*; they are in width (2 cent. = about 1 inch) exactly the same as the petals of the male parent; in shape they are intermediate between the two parents, having slightly-waved borders, the slipper is less long, but wider than that of *C. tonsum*; it has a very heavy look, and is, in colouring, like that of *Spicerianum*, the foliage is rather that of the latter, with more purple marbling. *Odontoglossum crispum* album received a Certificate of Merit *par acclamation*, it is the best white variety I know, the flower-stem bears eleven blooms of medium size and good form, full, and round; all the divisions of the flower are indistinctly, delicately crimped, the sepals and petals are pure white, the lip beautiful in form, the top and region near it are bright canary yellow, very effective against the white; the staminate is entirely white. *Miltonopsis Elei* (*Miltoia Blenana*), with three floral racemes, bears fourteen very large flowers, and has two stems still in bud, a fine plant, the splendid flowers of which exhale a perfume like that of certain Tea Roses. *Lælia anceps* var. *Hyeana* is an admirable variety with large snow-white flowers; the petals are from 1½ to 3 inches wide; the lip has a beautiful saffron-yellow tip, the yellow background lined with purple; it is a very strong plant with fourteen buds. M. J. Hye won a Certificate of Merit *par acclamation* for an unusually fine lot of *Odontoglossum*; we noted *O. crispum* *Albertianum*, very unusual, with a flower-stem bearing twenty-one blooms, yellow with red spots on all the divisions, and with the lip unusually broad. The flowers were not fully open.

There were a number of Orchids from M. A. Van Imshoort, including *Lælia* × *Cattleya* *Ghielaine*, raised from *L. harpophylla* × *Cattleya amethystoglossa*. The plant is still small, bearing two flowers, they were straw-coloured on opening; the sepals and petals have now lost this tint and the flower when shown was creamy-white; the lip is narrow, the edge dentated, bordered with red. The foliage resembles that of the mother-plant, and so does the flower in form. It is supposed that the plant when fully grown will bear, as do its parents, a truss of from six to nine flowers. The male parent had a white flower, dotted with red; it is curious that this red has disappeared in the seedling. This hybrid is the first seedling *Cattleya* raised in Belgium. The jury awarded for it a Certificate of Merit *à l'unanimité*.

We should mention as staged by M. Van Imshoort, *Ipeea speciosa*; a natural hybrid *Oacidium* from *O. fuscum* × *O. lamelligerum*, which has bulbs and foliage like those of *fuscum*, and flowers more resembling those of *lamelligerum*; *Lælia anceps* *Sanderiana*, very beautiful; *Epidendrum Endressi*, a very elegant small Orchid; and *Oncidium incurvum* album, with a fine truss of bloom.

M. Poelman Maenhout staged a pretty hybrid from *Cypripedium villosum* × *Boxalli*, named *C. Madame Petrick*. Traces of *villosum* are visible; those of *Boxalli* are less noticeable—the standard some think like that of *Spicerianum*, others like that of *Chantini*. The raiser is certain as to the parents of the plant, which seems a peculiar variety.

Apart from Orchids, there was shown by M. Edouard Pynaert, a new plant, *Graptophyllum picturatum* (*Acanthaceae*), a native of the islands of the Pacific Ocean. It is a greenhouse plant, with evergreen foliage, brightly variegated in the centre, very compact, of a beautiful golden-yellow colour. This coloration is irregularly arranged on each side of the mid-rib, and the dark green edge of the blade

is spotted with a pale green round the central variegation. M. L. De Smet showed a noteworthy new *Kentia*; a seedling from K. Balmoreana, which it resembles in habit. The stems and veins of the leaves are dark claret colour. The colour of the leaves is dark green, with a light reddish tinge; the plant is of dwarf habit, nice and leafy. The same exhibitor showed a fine *Alocasia Watsoniana* and *Aralia Veitchii robusta*, also a beautiful *Anthurium Scherzerianum* triumphans, with a spathe very long, fine in form, of a salmony flesh-pink colour, very delicate; a good variety. MM. Vervaeet et Cie. exhibited an excellent *Croton Massangeanus*. *Ch. de B.*

### HOME CORRESPONDENCE.

PROPAGATION OF *COPROSMA BAUERIANA*.—The propagation of this plant is often found a little difficult in private gardens, and of the many methods I have seen tried, the following has proved the most successful.—Cuttings of the young wood are taken either in the spring or autumn, and made into three-joint lengths, the leaves removed from the two lower joints, then the cutting inserted in sand, and plunged in bottom-heat with a bell-glass over them. Allow them to remain so for a fortnight, then take the cuttings out, and cut them over by the second joint, afterwards inserting them in the sand, and treating them as before, until rooted, when they should be carefully potted into small pots, and grown on in an intermediate temperature. Will some botanical reader of this note kindly inform me what function the little round holes on the under-side of the leaf perform? I observe there is one at the base of each of the side ribs, with the exception of the two lower ones next the foot-stalk of the leaf; the upper surface of the leaf is slightly raised just above the holes. *Alex. Morton*. [These holes probably serve the purpose of vents to get rid of any superfluous water. *En.*]

*BEGONIA ORTGIESII*.—What Mr. C. Herrin is growing at Dropmore under this name is represented by a greenhouse, evergreen, winter-flowering form, small-leaved, the leaf-surface a kind of bronzy-olive-green; the under-surface reddish, with red mainstalks and branches; blooming freely at this season of the year in small-flowered trusses or panicles, the colour yellow. Mr. Herrin speaks highly of it as a continuous bloomer for cutting at this season of the year. It is propagated by means of cuttings taken in the spring and rooted in a gentle bottom-heat. *R. D.*

GARDENERS AND STEAM-ENGINES.—I am sorry Mr. Mawson is about to suffer a keen disappointment, because we have arrived at the time when large grass lawns, cricket, tennis, and bowling-greens will be mown and rolled more expeditiously, and at considerable less cost both in time and labour than is being done with the cumbersome horse-machines. I also think that a professional gardener is quite as much in love with his garden and grounds as the professional artistic gardener, and that peace and beauty will reign equally well with a mower and roller worked with some motive-power other than manual or animal. We gardeners now-a-days are obliged to study the science of political economy, for the decreased income of many of our employers, and the consequent reduced garden staff, teach us the necessity of keeping up the gardening establishment at the least possible cost; but of course, where a landscape artist is working at the expense of the ratepayers, economy is not a consideration, otherwise our public parks and recreation-grounds would not cost the immense sums they do. As to "seeking our own destruction," or becoming mere "engine tenders," I pass that by for what it is worth, and say that everything now-a-days, even to the maintenance of large gardens and pleasure-grounds, and I should certainly see public parks, is or should be, worked on purely commercial principles, and every appliance adopted that will save the ratepayer's pockets, which is the true "economy with efficiency" policy; but artists, both garden and otherwise, are faddists, and see things with an artist's eye only, seeking to accomplish certain objects regardless of expense; but when we are told that if we "allow these things to invade our reposeful domains," we shall do an irreparable injury to one of the purest enjoyments of this country, "and that

no commercial excuse can hold good," I can only think that is the opinion of a very few uncommercial men in this age of progression. *Hortus*.

#### EARLY BLOOMING OF MAGNOLIA GRANDIFLORA

—On the 2nd inst. I picked a fully-developed bloom of *Magnolia grandiflora* (Exmouth variety) from a tree planted against a south-west wall at Exwick, near Exeter. *H.*

**DAFFODILS GOING BLIND.**—Concerning this malady, Mr. J. Walker, of Ham, told me a few years back that complaints often came from market growers of bulbs going blind, and he attributed it to their practice of removing the boxes or pots of bulbs after they have started growth and roots, direct from their outdoor quarters into strong heat. If that be so, then it serves to show that howsoever little excessive cold may affect bulbs, remembering of course that such cold as "J." refers to did not come like a thief in the night, but gradually grew to its ultimate intensity; yet sudden changing into undue heat may produce blindness. Mr. Walker's rule with Daffodils is to remove from outdoors into a cool-house for a short time, so as to accustom them to their improved surroundings, and to then pass them on to heat. In that case there are no failures. I am not giving this as my own experience. I prefer that of a great grower to my own, but it serves to show that there are cases when Daffodils may find, if not in cold, at least in heat, conditions unfavourable for flower production. That frosts do no very appreciable harm to true bulbs, may be due somewhat to their scaly formation. *Gladiolus curma* are not scaly, and do not suffer from frost. I submit this as a possible explanation. *A. D.*

**NARCISSUS FOR FORCING.**—There was some correspondence in the *Gardeners' Chronicle* last year respecting the suitability of certain kinds of Narcissus for forcing. My experience is that some of the later kinds force as well, and flower as soon, as some of the earlier varieties when subjected to exactly the same treatment. I am sending you flowers of several kinds which illustrate this; the plants were brought into gentle heat (with cool Odontoglossums) in November. Dr. Fell (a Wear-dale seedling), rather a late flower out-of-doors, has come as soon as princeps. Palmerston and Barri conspicuus are a little later. Besselmann major and Tenby were a few days earlier. Dr. Fell is a very free flowerer, and does better indoors than out, as it is liable to come behind in dry weather. *R. O. Backhouse*. [The flowers were very good, but that certain kinds of Narcissus are most adaptable to hard forcing has been proved over and over again. *Ed.*]

**JAPANESE NAMES OF BAMBOOS.**—In your answer to a correspondent as to the Japanese names of Bamboos, I am made to say "Shiko-chiku is = *Bambusa quadrangularis*; Shih-chiku is = *B. marliacea*." This is a printer's error. It should run thus:—"Shiho-chiku = *B. quadrangularis*; Shih-chiku = *B. marliacea*." I now find that Hotei-chiku is = *B. sterilis*, a synonym of *Phyllostachys aurea*, though the Japanese apparently consider it a separate species. *A. B. F. Mitford*.

**FARMERS AND FRUIT GROWING.**—Under this heading, I advocated a row of Celery to be planted on either side of a row of trees if they should need root-pruning. "A. D." p. 177, states the newly-pruned roots would be feeding grossly on the manure. I do not know how "A. D." treats his Celery; in this part it is usually planted in trenches varying in depth, a space of 2 to 3 feet being left on each side of the row for the purpose of earthing-up, and by the time this operation is completed in late autumn, what was once a trench is now a ridge, with a trench on each side from 1 to 2 feet deep, according to how the Celery has grown, and the depth it was planted. Assuming the Celery row to be 6 feet from the stems of the trees, there will be a trench at 3 feet from the stem when the Celery is earthed-up. How, then, can the roots of the trees revel in the manure applied to the Celery some 3 feet from where the roots were severed? "A. D." must have forgot that gardeners earth up their Celery plants. By planting Celery and other vegetables amongst the fruit trees, I contend it is infinitely more profitable than the trees alone for seven or eight years, and more persons get their living by vegetable growing than by fruit growing. Celery growing involves more labour than that of most vegetables, and always pays for the labour if nothing more, so that by following my advice, the work of root-pruning is paid for, and I leave your

readers to decide whether it is better or not than "A. D.'s" proposals, to lift all the trees and replant at the end of four years, which makes it certain that there will be no fruit the following year, and if after that we have a deficient Apple year or two, eight years will have gone without any return, and rent and rates have to be paid. I do not know if "A. D." has any idea how many trees, say, six or seven years old, two men would lift, replant, and stake in a day, a distance of 200 or 300 yards from where they are growing? May I ask "A. D." where did I advocate anything calculated to destroy surface-roots of fruit trees? *W. P. R., Preston*.

**A TRADE GARDENER'S REQUIREMENTS.**—I think that the letter which appeared under the above heading, and the comments on it will, after all, serve a useful purpose, by drawing the attention of young gardeners to what is often expected of a trade-grower or manager. How many, while working among the crops under their charge, think it worth their while to pay attention to what is going on, possibly on an adjoining plot of ground? stakeholes are made, houses are built, and fitted with the necessary heating-apparatus, but the young gardener takes no notice, probably thinking it does not concern him. And yet, if he would become a successful manager, he should have some knowledge of these necessary operations, or how will he be enabled to judge if the work is being carried out in a correct and economical manner? Speaking from an experience of market-work, extending over many years, I have found a knowledge of the afore-mentioned requirements absolutely essential. *Another Foreman*.

**CROCUS CREWELL** (the possession of which I owe to the great kindness of Mr. Whittall, of Smyrna), may not be a good species, since it is not sharply defined from the very variable *C. biflorus*; but it is a charming garden flower. The lavender inner segments are set off by the bold brown-purple veining of the outer one, while charm is added by the yellow throat, the bright vermilion stigma, and the almost black anthers. Its name recalls memories of one of the most skilful and best of gardeners. It has been in flower with me about a fortnight. *M. Foster*.

**RHODODENDRON NUTTALLI.**—Will Mr. J. D. Nanscawen kindly inform me through these columns under what conditions he grows his plant of *Rhododendron Nuttalli*; that is, whether under trees or fully exposed, in what situation, east, west, north, or south, and in what compost? I have tried to grow it out-of-doors several times in different positions, but the slight frost that we get always kill it, and I have not seen a plant of *R. Nuttalli* growing out-of-doors in Cornwall. *W. H. B.*

## NURSERY NOTES.

### PRIMULAS AT SWANLEY.

The Chinese Primula, so well in flower at the present time in many a garden, and represented in almost every one, is a flowering plant that has received great attention from Messrs. H. Cannell & Sons during the entire existence of the firm. The collection of varieties now in bloom at this place is sufficient evidence that the plant is regarded a most important one, and rightly so, for it is just one of those which suggest themselves—by reason of its simple requirements during growth, and its cheap, readily procurable seeds—as being "everybody's plant." We do not intend to dwell upon the large display the plants are now making in the many houses, for although the effect is charming, it is one with which most of our readers are familiar, but our remarks shall be upon the features and improvements of the various strains and colours. This may be noted, however, that whatever it may be Messrs. Cannell take an especial interest in, some part of that stock will in the near future be found at the newer ground at Eynsford. The head of the firm has a great opinion of that place, and before the whole of the stock of Primulas was seen we had driven thence.

#### "THE LADY" STRAIN,

As being the most novel, may be remarked first. "The Lady" was figured in the *Gardeners' Chronicle* in March last year, and is known widely

by this time. Its general appearance is slender, and its inflorescence being composed of a series of whorls, tier upon tier, the plant is very free-flowering, and numerous fresh spikes are continually produced from the base. The flower-stalks are deep purplish-crimson, the flowers a delicate porcelain-white, and the foliage is borne upon very long petioles. The plant has been recommended as well worthy of culture in itself, from the great profusion of blooms it produces, which are very light and agreeably graceful for use in a cut state, and because a group of such plants, when in bloom, presents a much more effective display than do the ordinary varieties. On the other hand, it could never take the place of the excellent large-flowered florists' strain, in which the satisfactory results of so much crossing and selection is evident. But it is not the value or the novelty of *The Lady* itself that induces us to write thus fully of its character. Mr. Cannell has taken the variety as a means of producing a new type of Primula, which he intends to call the "pyramidalis" strain.

We saw a group of plants with many of the peculiarities of "The Lady" in a modified degree, carrying improved flowers, both in size and purity of whiteness. These were called pyramidalis grandiflora alba, and have been obtained by crossing *The Lady* with *P. sinensis fimbriata* × Cannell's White. The progeny were next crossed back again with *The Lady*, and subsequently among the better forms of themselves. They are thus of a much mixed character. In these are seen the best results of crossing with this type yet obtained, and many will doubtless be disposed to favour them who were not admirers of the original plant. The slender habit is retained, the flowers have more substance, are larger, and of clearer white, with small yellow eye and the foliage is less rough and loose than in the type but capable of still further modification. We have no hesitation in saying that a group of the plants present a fine effect, being so numerously flowered. The spikes of blossom which had reached their third tier, were in many cases 16 inches high. The purple stems present considerable contrast to the white flowers. The strain as thus improved and anticipating yet further development, is one which will meet with considerable popularity; this much seems assured by its graceful and floriferous qualities. That it will be popular for an indefinite time is not so certain, especially when we remember that the single-flowered *Chrysanthemum*, which also combines these qualities, meet with comparative neglect, if judged by the favour lavished upon the monster-flowering section. In Dahlias, too, there was a gratifying inclination on the part of the public a few years since to encourage the single-flowered varieties, which for a time seemed quite general, but now there is a noticeable revulsion in favour of the large compass-made ideal of the florists.

Before leaving this section, it should be added that Purple Lady is a sport from the type, having purple flowers; and there has also been obtained a variety with more or less of yellow in the flowers. Clear pink and bright rose may follow.

#### SINGLE AND DOUBLE VARIETIES (FLORISTS').

In Eynsford Yellow we have the best of this colour yet included in the Swanley strain, and it shows much improvement. These yellow varieties are only acquired after considerable labour, as one of the commonest results of crossing them is to obtain an undue development in the calyx, with only malformed or very insignificant flowers. Eynsford Yellow is a very free flowerer, and the flowers when properly expanded are pretty, the base being clear yellow, encircled with a band of pure white. The two colours do not unite in a ring, but like wedges, and the petals are nicely fringed. The habit of the plain or Palm-leaved foliage is good, and the variety has come very true from seeds.

Cannell's Giant Improved is a good strain of the old-fashioned colour in which different persons see purple, rose and pink. It represents considerable advancement in size of flower, and general habit. In Cannell's Giant Pink

we have an excellent strain, and the blooms are equal in size to the largest. The colour is one of the most pleasing shades of pink, and is combined with good general habit. The Queen type is splendidly represented by Pink Queen, decidedly better than The Queen in colour and in size of bloom, the pink being fairly deep and well-fixed. Like The Queen, it has very beautiful Fern-like foliage, and the wing-like characteristics in the blossoms. *Defiance* impresses one as being somewhat similar to *Cannell's Giant*, noticed above, but the colour is far superior, being a good purple, and almost perfectly round, albeit the habit is rather less dwarf.

*Glowworm* represents a strain in the red-flowered class, with larger flowers, and borne upon longer pedicels than the *Old Chiswick Red*; though not higher coloured than the old one, it is more bold in

well-known and appreciated. It has flowers a little smaller than has *Cannell's White*, and has Fern-like foliage. In *Her Majesty* is seen an improved *White Perfection*; the variety has dark Fern-leaved foliage, pure white flowers, and is generally first-rate.

Double-flowered varieties are very useful, and the blossoms are frequently turned to account by the florists, but they are not so important or numerous as the single-flowered varieties.

Semi-double forms from seeds, with one exception, are not grown at this place, but the true double-flowered varieties are kept in large quantity, and are propagated by offsets. To mention the exception first: it is of a good red colour, such as none of the true doubles possess. Of the latter, few remarks are needed, as they are all well known. First, there is the old pure white one, *P. alba*, fl.-pl.; also *P. albo-*

FIG. 28.—PEAR, BEURRÉ PERRAN.

appearance, and better. *Cannell's Carmine* is likely to please those who admire a salmon-pink coloured flower. *Æsthetic* shades more particularly belong to varieties such as *Princess Beatrice*, a delicate pale mauve, and *Duchess of Eife*, very pale pink, with Queen type of flower and foliage. The deeper colour upon the margins of the petals of the last named enhance its appearance. Of coloured single flowers there yet remains to be mentioned *Cannell's Blue*, which, although not as blue as a *Bluebell*, is as nearly such as the *Primula* has yet shown itself disposed to become.

Turning our attention to white varieties, there is *Cannell's White*, with good large blossoms of satisfactory substance, and plain or Palm-leaved foliage, very well fixed by being grown many years, and constantly selected. *Eynsford White* is more attractive though, and has blossoms of pure white [excepting, of course, the persistent yellow eye], and prettily crimped petals; the foliage is slightly moss-curl'd also. *White Perfection* is thoroughly

*fimbriata*, with similar blossoms of little larger size; then *Annie Hillier*, brought out by a nurseryman of that name, living at Winchester, and bearing pretty pale-flesh or pink flowers; and *King of the Purples*, which has been in cultivation for very many years. The best of the double varieties, however, are those which the late Mr. Gilbert sent out some years ago from Burghley gardens. Two of them are *Marchioness of Exeter*, white; and *Earl of Beaconsfield*, deep pink; they produce flowers larger in size than any others, and are as valuable as when first sent out. Several others introduced at the same time with varietal names were merely intermediate forms, to which both of those named occasionally sport, and they are not worth keeping distinct.

Other flowers in season at Swanley at present include a house full of *Cyclamens*, a large number of *Cinerarias* just commencing to bloom, and the winter-flowering *Begonias*, which are still gay in the structure they have adorned for several months past.

## PEAR BEURRÉ PERRAN.

This is a new variety which we believe will become very valuable. Our list of Pears of good quality, suitable for use during January and February, is not an extensive one, and any addition to it, providing the quality of the fruit is good, will be sure of a welcome. Such will be found in the variety represented by our illustration (fig. 28), which we are enabled to reproduce by the courtesy of Mr. W. S. Hurlstone, Parkfield Gardens, Hallow, near Worcester, who has kindly sent samples of the fruit to this office. Mr. Hurlstone writes that "The Pear was imported some thirty years or more ago by Mr. Smith, of the Worcester Nurseries, and Mr. Lea tells me he has had it for about twenty-seven years. I had never seen or heard of it until I came here last season. It is a grand Pear considering its season, and on a warmer soil than ours, which is clayey, it would probably be better." The actual size of the fruits grown at Parkfield have averaged a little larger than the specimen we have reproduced, and Mr. Hurlstone suggests that they would possibly be larger still on better soil. The shape of the fruit is well shown by our figure, and is rather short but thick, has an irregular surface, a long stem inserted in shallow basin, and open eye also shallow. The colour is pale yellow, but nearly covered with russet spots and blotches. It is really in season immediately after Christmas, though it is expected the fruits will keep until the end of February. For such a season the flavour is rich and good, flesh very melting, with a tolerably thick skin. An Award of Merit was granted the variety when exhibited before the Royal Horticultural Society on January 14, from the garden of C. W. Lea, Esq., Parkfield.

## GENEVA.

GENEVESE botany has sustained a great loss in the person of Dr. Müller (Argau), whose rather sudden and quite unexpected death we all here deplore very much. Besides being a very distinguished botanist, he was the kindest and most disinterested of men. Having lost his only son some years ago, and his wife being, it appears, sufficiently provided for, he showed his great generosity in bequeathing to the town of Geneva a sum of 30,000 francs, to be spent in the Delessert Herbarium, and another sum of 10,000 francs for the botanical laboratory at the University. *C. de Candolle*.

## Obituary.

JOHN REID.—Many readers of the *Gardeners Chronicle* residing in the northern parts of this country and in Scotland will learn with regret of the death on February 6, at the age of 82 years, of John Reid, who for nearly 66 years had been in the employment of Messrs. W. & T. Samson, seedsmen and nurserymen, of Kilmarnock. The deceased had filled the post of out-of-doors manager for nearly 50 years, and was well known in consequence amongst gardeners and the trade.

## VARIORUM.

ANOTHER EDIBLE LILY.—The firm of J. C. Schmidt, of Erfurt, puts into commerce, under the name of *Jamma Juri* [*Yama Yuri*, see p. 136 of the *Gardeners' Chronicle*. Ed.] another Lily root, which may, however, be identical with *Lilium tabern.* mentioned in our last issue. According to the description, *L. Jamma Juri* resembles our "Fire Lily," *L. bulbiferum*. It is perfectly hardy, and is prepared for table like *Asparagus*, *Cauliflower*, &c. One thing is certain, the vegetarian will rejoice to the full that the enriching of his menu is assured. The present year has so far been favourable to him, and there are missing only the *Spinach Violet*, *Viola edulis*, and the acidulous *Salad Rose*, *Rosa esculenta*, and the poetry of flowers receives a severe blow. *Pfeiffer*, in "*Illustrirte Flora*" for February.

## SOCIETIES.

## ROYAL HORTICULTURAL.

FEBRUARY 11.—There was quite an exceptional attendance at the meeting of the Committees in the Drill Hall, James Street, Westminster, on Tuesday last, the tables being thronged with members. Exhibits were also numerous, and the hall was nicely filled. An unexpected display of fruit was made, including fine collections from many of the trade growers, and some meritorious ones also from amateurs. Among the latter was a large collection of Apples from HER MAJESTY'S garden at Frogmore. Primulas and Cyclameus, together with other such plants in season were capitally shown, and were effective in the display. A few hardy flowers, such as Snowdrops, early Narcissus, and the like were staged for the first time this season. Orchids were shown in quantity quite up to the average. In the afternoon was held the annual meeting of the society, in the Lindley Library room at 117, Victoria Street. There was a large attendance, many Fellows being unable to gain admission.

## Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. Joo. Fraser, Owen Thomas, Joo. Laing, H. B. May, Geo. Nicholson, H. Herbst, W. Barr, Robt. Owen, R. Dean, E. Molyneux, J. H. Fitt, Geo. Stevens, J. F. McLeod, H. Selve-Leonard, Jas. Hudson, R. B. Lowe, C. J. Salter, R. M. Hogg, J. Fraser, J. D. Pawle, Chas. E. Pearson, W. Bain, Chas. Jeffries, J. T. Rennett-Poë, Chas. E. Shea, Ed. Mawley, H. H. D'Ombraim, H. J. Jones, E. L. Beckett, H. Turner, Geo. Paul, Chas. T. Druery, and Geo. Gordon.

A very large collection of Primula sinensis varieties was shown by Mr. JNO. R. BOX, West Wickham and Croydon. Marchioness of Lorne, Blush White, Intensity Red, Pink Queen, very pale in colour, with Fern foliage; Emperor Improved, Wickham Surprise, Blush White, Wickham White, King of the Blues, White Perfection, and Cannell's Pink, all single-flowered varieties, were most noticeable. The plants were capitally grown and finely flowered (Silver-gilt Medal).

Flowers of Primula sinensis varieties were also shown by Messrs. JAS. VEITCH & SONS, Chelsea, and Mr. W. BULL, King's Road, Chelsea, in each case to illustrate the quality of the strain.

Messrs. H. CANNELL & SONS, Swanley, Kent, sent a dozen or so plants of Primula sinensis, representing their best varieties, which are referred to on p. 204 (Bronze Flora Medal).

Messrs. JAS. VEITCH & SONS made a large exhibit of their blue-flowered Primroses, seedlings from the stock raised by Mr. G. F. Wilson. The plants were in pots, and carried numerous flowers, containing many degrees in the character of the blue, which in some cases may be described as purple-blue (Silver Banksian Medal).

A good strain of Cyclamen was exhibited by Mr. JNO. MAY, Gordon Nursery, St. Margaret's, Twickenham, who had a collection in which the flowers were large, and of bright, distinct colours. One of the varieties, named Vivian, was of an exceptional colour, and the strain was recommended an Award of Merit (Silver Flora Medal).

From Mr. CHAS. TURNER, Royal Nurseries, Slough, came collection of varieties of Cyclamen persicum, representing considerable variety and colour, also creating a very gay effect, but coloured varieties were fewer than white ones (Silver Banksian Medal).

A miscellaneous group of plants, staged by Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., contained a few Crotons, Dracenas, and other foliage plants, also Cyclamen, Peonies, and a few Orchids. Some Bertolonias were also effective (Silver Flora Medal).

Messrs. JNO. PED & SONS, Rouppell Park Nurseries, Norwood Road, London, S.E., exhibited a small miscellaneous group of plants, in which a few Orchids, Cyclamens, and Hartztonia brightened the foliage plants included (Silver Banksian Medal).

Mr. F. W. MOORE sent, from the Royal Botanic Garden at Glasnevin, blooms and foliage of Dombeya Wallichii, blooms of Iris stylosa alba, a fruiting branch of Dermatobotrys Saundersii, and blooms of a Rhododendron.

Mr. W. J. GODFREY, The Nurseries, Exmouth, sent some Callas blooms, said to be of different variety, but we could see no difference except in the size of the spathe, apparently the result of cultivation.

Messrs. J. VEITCH & SONS, King's Road, Chelsea, showed several hybrid Cinerarias obtained from a cross between C. cruenta and a garden variety. The plants differed from each other slightly in the colour of the flowers, some being self-coloured, others having a white ring. Also a hybrid Rhododendron, obtained from a cross between R. malayanum and R. javanicum var. Monarch. The flowers of this plant are not very showy, being rather small. In colour they are orange scarlet; the leaves small, and very dark in colour. The curious-flowered Hamamelis japonica var. Zuccariniana, was also shown.

Hardy flowers were shown by Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham, and Messrs. P. BARR & SONS, King Street, Covent Garden. The first-named exhibitor had several varieties of Galathea, including G. Elwesii, and a variety of the latter named F. Fell, a very fine Snowdrop indeed. The curious and fetid-flowered Scillopus Bigelowii (figured in *Gardeners' Chronicle*, March 3, 1894, p. 287), Nar-

cissus × Henry Irving, obobis, and 'others. He also showed Iris histrioides flowering in pots, and the exceptionally delicate-looking Iris Danfordiae, which produces yellow blossoms only 2 or 3 inches from the soil. Leucocum carpaticum was shown, and gained a First-class Certificate. It is a form of L. vernum but has much larger blossoms, and always bears two flowers on the scape. The flowers are white with the usual green tips more distinct, and the yellow anthers make the flower quite a showy one (Bronze Banksian Medal).

Messrs. BARR & SONS, showed some flowering plants of Primula obconica grandiflora, numerous varieties of Helleborus, Scilla bifolia, Narcissus mimimus, Chionodoxa Luciliae, and Galanthus Ikarie (Bronze Flora Medal).

A new system of glazing was exhibited by Mr. H. BECKER, Fruit Grower, Jersey. The advantages claimed by the exhibitor for the system, are briefly that no putty or outside painting will be required. The glass can easily be adjusted or taken out by unskilled labour, hence they are called Moveable Glass Roofs. The sash bars are squared, but no rabbets are needed.

Mr. TUBBENTHAL sent from Berlin some Cyclamen flowers. These were to illustrate the quality of the German strain, in comparison with those grown in this country, the subject having been recently discussed in these columns. Making allowance for the long journey, and for the fact that the flowers were taken from plants which had been a long time in bloom, it is still clear, from the specimen sent, that although the German strain may be superior to the plants raised there from seed obtained from England, it is by no means so good as we are accustomed to see here.

Messrs. W. PAUL & SON, Waltham Cross, Herts, exhibited a small, fairly well-bloomed collection of Camellias, the plants ranging from 3 to 5 feet in height. Noticeable were C. corallina, deep crimson; Madame Ambrose Verschaffel, bright flesh-pink, a flat-formed, full-petalled flower; Exquisite, an imbricated, rose-red-coloured, fine flower; Princess Marie Amelia d'Orleans, pale pink, with reflexed petals—very nice; the showy, bright, rose-coloured Marchioness of Exeter and Lady Hume's Blush. Eight boxes of Camellia blooms, in fine variety, formed an edging to the group.

It is very gratifying that Messrs. PAUL & SON continue to exhibit their beautiful varieties of this plant to an unappreciative generation; and we hope they will have their reward in witnessing a revival of its culture. Mention should be made of Beauty of Waltham, a very pretty bluish-tinted flower, of good form, with markedly volute petals.

E. H. WOODALL, Esq., St. Nicholas House, Scarborough, exhibited a plant of the scarlet-flowered *Cyrtanthus parviflorus* (Award of Merit).

An excellent group of plants of *Lachenalia Nelsonii* in flower came from LORD SUFFIELD, Gunton Park, Norwich (gr. Mr. W. Allen), (Silver Banksian Medal).

Messrs. PAUL & SON, Cheshunt, staged cut blooms of Roses in two boxes of known varieties, which were excellent for the season. Some plants of Paul's Snow White *Daphne Mezereum* (alba?) were also shown (Silver Banksian Medal).

## Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, F. C. Jacob, W. H. Frothero, J. O. Fowler, J. Gabriel, Chas. Piker, T. Peed, F. Sander, T. W. Bond, E. Hill, J. Douglas, C. Wiun, F. Masoo, W. Cobb, E. Handley, T. B. Haywood, S. Courtauld, E. Ashworth, T. Statter, and H. J. Chapman.

There was a very fine show of Orchids, several very important groups being staged, and exhibits submitted, though few of them secured awards.

The Right Honble. JOSEPH CHAMBERLAIN, Birmingham (gr. Mr. H. A. Burberry), sent the first fruits of his operations in Orchid-hybridising, which were very promising. The first, a very beautiful *Masdevallia*, was obtained by crossing M. Harryana and M. Shuttleworthii, and was consequently, so far as the parentage was concerned, M × Shuttleworthiana. In beauty Mr. CHAMBERLAIN'S was immeasurably superior to the type, and was called M × Shuttleworthiana, Chamberlain's variety, to distinguish it. Its broad, handsome flower was of a clear rose-purple, with delicate red-purple spots at the base of the connate lower sepals, and red and yellow lines in the upper sepal. Each segment was furnished with a long, reflexed, yellow tail (Award of Merit) The second was *Dendrobium* × *Andromeda* (*Leochianum* × *Cassiope*), a very pretty and floriferous hybrid, with cream-white flowers slightly tinted with pink, and with purple disc to the labellum.

The Hon. WALTER ROTHSCHILD, Tring Park (gr. Mr. E. Hill), showed a fine example of *Houlletia trigina*, with two spikes of large and finely-coloured flowers, the one bearing two and the other four. The plant had been but once before exhibited, when we gave an illustration of it on p. 549 (Nov. 9, 1895). It received an Award of Merit.

Sir TREVOR LAWRENCE, Bart., Burford, Dorset (gr. Mr. W. H. White), showed a pretty group of Orchids, and secured a Silver Banksian Medal. The prominent features were a fine basket of the charming *Dendrobium* × *Burfordiana* (*Linawianum* × *aurum*), covered with rose-tinted flowers; D. × *palens*, a *Findleyanum* cross, and one of the most delicately tinted of hybrid *Dendrobis* (Award of Merit); *Masdevallia Henriette* (*ignea* × *Shuttleworthii*), a curious Indian red-tinted flower (Award of Merit); a grand example of *Pleurothallis Rozeii*, with numerous long-drooping racemes of purple flowers (Cultural Commendation); a noble specimen of *Dendrobium* × *Dominianum* (*Lioawianum* × *obile*); *Masdevallia melanopus*, M. Fraseri, and some fine examples of *Cyrtipedium villosum*, a species which not having previously received an award, was now given an Award of Merit; and *Cyrtipedium villosum aurum*.

Baron Sir H. SCHRODER, The Dell, Egham (gr., Mr. H. Ballantine), was awarded a Silver Flora Medal for a plant of the magnificent, blotched *Odontoglossum crispum obobis*, with seventeen flowers on a spike—one of the most beautiful examples of *Odontoglossum* yet exhibited. Baron SCHRODER also showed a fine O. Andersonianum.

Frau IDA BRANDT, Villa Brandt, Riesbach, Zurich, Switzerland, sent a very fine form of *Odontoglossum Rossii rubescens* (Award of Merit).

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, staged a fine group of Orchids, at the back of which were some splendid forms of *Cattleya Trianaei*, *Dendrobium splendissimum grandiflorum*, *Phaius Blumae*, &c. Noticeable among other plants were *Dendrobium* × *Cordelia* and D. × *Cordelia flavescens*, which gave a remarkable instance of reversion to be expected from secondary or complex parentages. D. × *Cordelia enosmum leucopterum* ♂, *aurum* ♀) has on the male side a cross derived from *nobile intermedium* × *endocharis* (*aurum* × *moniliforme* (japonicum)). The typical D. × *Cordelia* is like a small *Hlaetifolium* D. × *Ainsworthii*, and the variety *flavescens* is so all but the odour, practically D. *aurum*. Messrs. VEITCH also showed *Selenipedium* × *Dromio* (*caudatum Lindenii* ♂, *cardinale* ♀); *Cyrtipedium* × *Germoyanum*, C. × *Lathamianum*, C. × *Io graude*, *Dendrobium Wardianum-japonicum*, *Saccolabium violaceum Har-risonianum*, *Epidendrum* × *Endrosio-Wallisii*, &c. (Silver Flora Medal).

Messrs. F. SANDER & Co. staged a fine group, in which were *Phaius* × *Cooksoni* and varieties of *Phaius-Calanthe* × *Ar-oldie*; a fine *Cyrtipedium Rothschildianum*, the beautiful *Dendrobium* × *Sybil* (*bigibbum* × *Linawianum*); D. × *Vannerianum* (*moniliforme* × *Falcoeri*), fine specimens of *Dendrobium Findlayianum* and D. × *Ainsworthii*; *Pescatorea Klabochoorum* and P. Lehmanni; *Lycaste Skinneri alba*; *Laelia anceps Schroderiana*, L. Sanderiana, and L. Hollidayana; the pretty and floriferous *Dendrobium* × *Curtisii* (*Cassiope* × *aurum*); the *Laelia*-like D. *Johnsonii*; *Cattleya Trianaei alba* and other varieties; *Trichopilia sanguinolenta*, *Oncidium cheiriphrum*, &c. (Silver Flora Medal).

ELIJAH ASHWORTH, Esq., Harefield Hall, Wilmslow, Cheshire (gr. Mr. Holbroock), staged a remarkable group of cut examples of many species of Orchids, to whom a Silver Banksian Medal was awarded; also a splendid plant of the rich ruby-red *Cyrtipedium* × *Leyceianum* (*barbatum Crossii* × *bellatulum*), and for which a special Vote of Thanks was passed, the plant having previously received a First-class Certificate; also *Dendrobium* × *Wardianum-japonicum*.

R. I. MEASTRES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), was awarded a Silver Banksian Medal for a good group of Orchids, in the centre of which was the pretty *Cyrtipedium* × *Pegasus* (*Leeaanum* ♀, *Morganii* ♂). The flowers, though very beautiful and distinct, were scarcely what would be expected from such a cross. In general appearance they were like a very large C. × *Arthurianum*, the upper half of the dorsal sepal pure white, and both sepals and petals evenly and prettily blotched with purple and chocolate. In the group were a richly-coloured *Cattleya Trianaei*; the fine *Cyrtipedium* × *Oleums*; C. × *Leonia* *Lady-mead* var. C. × *Calypso superbum*, C. × *polium*, *Saccolabium bellium*, *Dendrobium* × *Dominianum*, D. *obile* *Balianum*, and some grand plants of *Cyrtipedium villosum* (Award of Merit).

Messrs. HUGH LOW & Co., Clapton, staged a pretty group, consisting principally of *Phalenopsis*, P. *Stuartiana* and P. *Schilleriana* being exceptionally good. *Cymbidium Lowianum* and many varieties of *Cyrtipedium* gave variety, and of special interest was the pretty little white *Dendrobium* fragrans, which received a Botanical Certificate, and *Cynorchis Lowii*. The group was awarded a Silver Banksian Medal.

Messrs. B. S. WILLIAMS & SON, Upper Holloway, staged a group of Orchids, remarkable for the fine varieties of *Cyrtipedium*, of which the massive and richly-coloured C. × *Pithecanium*, Williams' variety, was, as it always is when shown, the finest of its class. C. *Bonalli marginatum* was also remarkable for the fine white band on its dorsal sepal. *Pescatorea Selmanni* and *Laelia glauca* were also included (Silver Banksian Medal).

T. GAUBRIEL, Esq., Elmstead, Leigham Court Road, Streatham (gr. Mr. H. Guyett), staged a group composed of finely-flowered specimens of *Cyclogyne cristata* (Silver Banksian Medal).

Messrs. HEATH & SON, Cheltenham, showed *Phalenopsis* × *Veitchiana* (*rosea*, ♂ *Schilleriana* ♀), a fine hybrid, with the colours of P. *Schilleriana*, but with the front lobe of the lip as in P. *rosea*; the plant had previously had a First-class Certificate; the fine *Cattleya Trianaei* *Ernesti*, the beautiful C. T. *Diadem*, *Dendrobium Findlayianum giganteum*, and a very fine form of *Phalenopsis Schilleriana*.

A. J. HOLLINGTON, Esq., Forty Hill, Enfield, showed three very fine and distinct hybrid *Cyrtipediums*, viz., C. × *James Bockingham* (*Enfieldense* × *bellatulum*), which had very finely-formed flowers of the C. × *Chas. Richman* class, which were tinted with rose-purple, and spotted with chocolate (Award of Merit); C. × *Annie Ayling* (*Curtisii* × *concolor*), which some persons considered the more distinct, its long, slightly falcate petals, densely dotted with dark purple on rose ground making it very effective; and C. × *Mrs. Fred Hardy* (*superbens* × *bellatulum*).

THOS. STATTER, Esq., Stand Hill, Whitefield, Manchester (gr. Mr. R. Johnson), showed *Cyrtipedium oxul superbum* var. *Anemense*; C. × *amabile*; C. × *Jamesoniana* (*Arthurianum* × *Leeaanum superbum*); C. × *Bragainum*.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent *Maxillaria porphyrostela* (Botanical Certificate), and *Selenipedium Klottzeianum*.

E. H. WOODALL, Esq., St. Nicholas House, Scarborough (gr., Mr. Hughes), showed the pretty orange scarlet *Odontoglossum retusum* (Cultural Commendation); and WALTER

C. WALKER, Esq., Percy Lodge, Winchmore Hill (gr., Mr. Geo. Cragg), sent *Dendrobium speciosum* (Botanical Certificate).

#### Fruit Committee.

**Present:** Philip Crowley, Esq. (Chairman), and Messrs. Geo. Bynard, T. Francis Rivers, Jas. H. Veitch, Wm. Pope, T. J. Saltmarsh, A. H. Pearson, J. Wright, Alex. Dean, Jno. A. Laing, Gen. Woodward, J. W. Bates, T. Glen, C. Herrin, G. T. Miles, Geo. Wythes, G. H. Sage, H. Balderson, G. W. Cummins, J. Cheal, Henry J. Pearson, F. Q. Lane, J. Willard, and Robt. Fife.

Messrs. H. LANE & CO., Berkhamsted, exhibited upwards of fifty dishes of Apples in as many varieties—culinary and dessert. The popular variety, Lane's Prince Albert, was finely represented in this collection, though the fruits were slightly damaged by hail. Oaklands Seedling is one of the very best keeping dessert varieties, being like Sturmer Pippin in consistency, and in flavour a little like Cox's Orange Pippin. It was raised about sixteen years ago. Many other good Apples were represented, and a few seedlings (Silver Knightian Medal).

Lord FOLEY, Ruxley Lodge, Claygate, Esher (gr., Mr. J. W. Miller), contributed a collection of fruit, including numerous dishes of Apples and Pears, three bunches of Black Alcheate Grapes, some Nuts, and a nice sample of Mushrooms (Bronze Banksian Medal).

A. H. SNEE, Esq., exhibited from "My Garden," The Grange, Wallington, Surrey (gr., Mr. G. W. Cummins), upwards of sixty dishes of Apples and Pears, all very bright and fresh-looking, being in excellent preservation (Silver-gilt Knightian Medal).

A capital collection of Apples and Oranges was exhibited by Messrs. T. F. RIVERS & SON, Sawbridgeworth, Herts. Among the Apples were noticed Buckingham, Peck's Pleasant, Cox's Orange Pippin, Bismarck, Biron, King of Tomkin's County, all very fresh and excellent (Silver Knightian Medal).

A larger collection of Apples was that from Messrs. GEO. BUNYARD & CO., which included one hundred dishes in the same number of varieties, representing splendid colour and preservation (Silver-Gilt Knightian Medal).

HER MAJESTY THE QUEEN exhibited one hundred dishes of Apples from the Royal Gardens, Frogmore. This was an excellent collection, consisting of medium-sized fruits of splendid quality, well coloured, and in good preservation. Each dish was labelled, and in a neat and effective manner (Silver-gilt Knightian Medal).

Another collection of fruit, including about ninety dishes of Apples and Pears, was staged by Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley, Sussex, and worthy of great commendation (Silver Knightian Medal).

Mr. J. R. STEVENS, Clayton Nursery, Hassocks, Sussex, exhibited half-a-dozen plants of Strawberry Stevens' Wonder, some of which were carrying ripe fruits; also a small box containing ripe fruits.

From J. R. SAN, Esq., Bernard Street, Russell Square, London, was sent some fruits of an Apple called Beauty Pippin, said to have been raised twenty years ago, from seeds of Beauty of Kent, but apparently identical with Bess Pool.

Messrs. J. R. PEARSON & SONS, Chilwell, Notts, showed fruits of a good sized highly-coloured Apple called Clifton Seedling.

Mr. J. H. SHEPPARD, High Street, Bedford, had Apple Clapham Beauty.

Mr. H. BALDERSON, Corner Hall, Hemel Hempstead, exhibited Apple Scott's Prolific, a pretty, good-sized fruit.

J. G. MORRIS, Esq., Allerton Priory, Liverpool (gr., Mr. J. J. Craven), had a culinary Apple named Pomeroy of Lancashire.

Mr. DIVERS, gr. to the DUKE OF RUTLAND, Belvoir Castle, Grantham, again sent fruits of Apples Jenkinson's Seedling and Dewdney's Seedling. No awards were made to Apples on this occasion.

From HER MAJESTY THE QUEEN'S Garden, at Frogmore, Mr. O. Thomas exhibited a dozen fruits of a medium-sized pretty-looking Cucumber, Frogmore Winter Prolific. The fruits were of useful size and good colour.

An excellent lot of Apples came from the gardens of the Hon. G. M. FORTESCUE, Dropmore, Maidenhead (gr., Mr. C. Herrin). The collection consisted of Apples in season, and well-preserved specimens of earlier ripening varieties. We noted Ribston and Cox's Pippins, Dutch Mignonne, an Apple which there crops heavily as an orchard standard; Hubbard's Pearmain, Royal, and Baumann's Russets, Court Pendu Plat Lane's Prince Albert in excellent form, and as fresh as when gathered; and Beauty of Kent equally so, and Clark's Pippin? An award was made of a Banksian Medal.

Messrs. JOHN LAING & SONS, Stanstead Park Nursery, Forest Hill, showed a collection of Apples, chiefly bright, large and well-coloured, some apparently home-grown specimens. A Silver Knightian Medal was awarded.

#### ANNUAL MEETING.

THE Annual General Meeting of the Fellows of this Society was held at the Offices, 117, Victoria Street, Westminster, on Tuesday afternoon last. Sir Trevor Lawrence, Bart., the President, occupied the Chair, and there was an exceptionally large attendance of Fellows and members.

#### THE DEATH OF PRINCE HENRY OF BATTENBERG.

The President said, before they commenced the business ordinarily transacted at the meeting, he believed it

would be in accordance with the feelings of the entire community, and certainly of the Fellows of that Society, having regard to the fact that Her Most Gracious Majesty was Patron of the Society, that they should offer to the Queen, with the utmost respect, an address of sympathy at the grievous loss which had befallen her in the death of Prince Henry of Battenberg.—The meeting signified an unanimous assent to the proposal.

The Secretary (Rev. W. Wilks) having read the notice convening the meeting and the minutes of the last Annual General Meeting, several new Fellows were elected; at the present meeting the number was 88—a gain of 29 upon the preceding period of last year.

#### RETIRING COUNCILLORS.

The President proposed a hearty vote of thanks to the retiring members of the Council—Sir John Edwards Moss, Bart., Mr. Owen Thomas, and Mr. Henry Williams.

#### NEW COUNCILLORS.

The vacancies caused by the above retirements were filled by the Rev. G. H. Engleheart, Mr. Thomas Gabriel, and Mr. MacLachlan.

#### The adoption of the Report.

The President then rose to move the adoption of the Council's Report for the year (see p. 88). He said it was usual to make a few comments on the various matters dealt with in the report, and he proposed to touch upon each subject as it occurred. The first matter dealt with was the issue and circulation of a new Code of rules and suggestions for judges and schedule makers. He was glad to say that these rules and suggestions had been received with very general acceptance. They had not been exempt from criticism, and it was not desirable they should be; but he thought that on the whole it could be said that they had been very well received. They were not intended to be more than a beginning, or a basis for a code of rules, and the Council would be glad of any useful suggestions as to modifications or improvements. It was desirable that there should be a reasonable uniformity in the judging of horticultural exhibits, and he was sure they would allow him to convey their thanks to the many gentlemen who had been kind enough to give a considerable amount of time and attention to the drawing up of the rules.

The next matter referred to was the retirement of Mr. Barron. He was expressing the sentiments of every member of the Council when he said that they fully recognised the very valuable services that gentleman had rendered to the Society during a very long course of years. During the disastrous period preceding the termination of the Society's connection with South Kensington, when persistent attempts were made to subordinate horticulture to roller-skating and lawn-tennis, they were indebted in no small measure to Mr. Barron's exertions. The Council considered that Mr. Barron's services were entitled to recognition, and they were glad to say it was in their power to make him a retiring allowance. He was pleased to say that Mr. Barron had expressed himself perfectly satisfied.

The next point touched upon referred to Chiswick Gardens. A new Superintendent—Mr. S. T. Wright, hitherto of Glewston Court Gardens, Ross—had been appointed. The merits of the various applicants were carefully considered, and the Council believed they had found in Mr. Wright a thoroughly good man. Mr. Wright came to them with excellent references, and it was believed he would discharge his duties in a manner which would do credit to himself and to the Society. As to the future of Chiswick Gardens, the Council had very carefully considered what would be the proper course to take, and they had decided to give Mr. Wright full scope, and not to hamper him with a too definite programme. They were anxious that experiments on a more extended scale than had hitherto been the case should be carried out in hybridisation, etc., and in raising of new varieties of plants. It was also very desirable that something should be done for the country fellows. Those living in and near London were able to take full advantage of the numerous shows which were held in London, but of course the country fellows—or many of them—lived so far away that they were unable to visit the shows habitually, and the Council would like to be able to offer them such a selection of valuable and useful plants as they might reasonably do without in any way competing with the horticultural trade. The aim and object of the Council was to make Chiswick such a garden as any Fellow of the Society would like to show a friend from the provinces or abroad.

The next subject referred to was the Temple Show. That was a brilliant success. The fortnightly meetings had been supported in a way which showed the confidence of the horticulturists of this country. The shows had almost without exception, in whatever period of the year they had been held, been most interesting and attractive, and this was proved by the far larger attendances now than formerly. The Crystal Palace Show was also very successful. With reference to the Vegetable Show at Chiswick, he confessed that he was rather disappointed, but it was a disappointment for

which they were not quite unprepared, because for some inscrutable reason vegetables, although admirably grown in this country, did not receive the same attention as other things. He thought it was unfortunate that vegetables did not receive more attention, not only for show purposes, but also for dietetic reasons. Vegetables were a most valuable food, as was shown by the fact that in many parts of the world people lived entirely upon vegetable food.

The next point dealt with the Medals which the Society was offering to encourage individual research and effort in obtaining new plants either by importation or hybridisation. He did not know that it was necessary to stimulate the enterprise of horticulturists, but it was thought that those who succeeded in raising a new plant should receive the recognition of the Royal Horticultural Society. Therefore he thought the Council had done wisely in offering these medals.

There was one matter mentioned in the report to which he would like to allude: it referred to the labours of the Scientific Committee, and regret was expressed that a greater use was not made of the Committee's services. When they saw the list of members composing the Scientific Committee, and saw who were the eminent men who sat upon that Committee, he thought it would be seen that difficult points—those connected with the physiology of horticulture and the like—might with advantage be wisely referred to the decision of that Committee.

With regard to the *Journal*, he believed it was received by the Fellows with great satisfaction, and they were constantly receiving applications for copies from all parts, and from other societies.

Then with regard to the provinces, a movement was set on foot, and considerable progress had been made in the affiliation of provincial societies with the parent Society in London. They began with one or two, and now they had 79, and the number was daily increasing. An opinion had been expressed that the Society would do well to hold shows in the provinces, but when they recollected that, as a result of the show at Liverpool the Society was obliged to call upon the local guarantors, and was nearly £1,500 out of pocket as well, they would see that it was necessary to use the greatest possible caution in the matter. The Society had, however, received several invitations this year, and the Council thought they were acting in accordance with the desires of the Fellows in accepting some of them. They had consequently accepted the invitation from Chester to be represented at the great floral fête and gala there in August next, and the invitation for the floral fête and gala at York in June. It was thought desirable that they should not visit the provinces too frequently, but that they should confine themselves at present to two occasions in each year.

Mr. Snee had raised a question as to the election of Council, but all he could say was that the Council were governed strictly by the bye-laws. These bye-laws were placed before the Committee, and they were drafted after consideration, and in consultation with the solicitors of the Society. The bye-law under which they could alone act was as follows: "Any two Fellows may recommend any other Fellow for removal from or election to the Council, or for appointment to the offices of President, Treasurer, Secretary, and Auditors, such Fellows leaving notice in writing of their proposal at the offices of the Society on or before the 10th day of January in each year."

In conclusion, he desired to make a statement. The Council were aware that the conduct of the affairs of the Society by the Council had been made the subject of considerable criticism. The Council were in no way sorry on that account, for it indicated that an active and keen interest in the affairs of the Society was being taken by the Fellows. The Council claimed no exemption from liability to err, but they did claim that the new policy which had been consistently pursued since the Society left South Kensington had rehabilitated the Society in every way. A few figures would prove that up to the year 1889, every year, with rare exceptions, showed a deficit. In 1885, there was a deficit of £120; in 1886, the deficit was £780; in 1887, it was £684; and in 1889, the deficit was £453. He was thankful to say that since that year they had ceased to have any deficit; and not only was that the case, but owing to careful—though not too careful—management, the finances of the Society were in a sound condition, and they had a sum of between £2,000 and £3,000 in hand. The next figures he would refer to were the subscriptions. These had increased from £1,990 in 1887 to £3,355 in 1895, or about 69 per cent. The circulation of the *Journal* had increased 100 per cent. The cost of printing it was £3,470; the receipts from advertisements and sales was £1,960. The net cost of the *Journal* therefore was £1,510, or £215 per annum. The Fellows elected from 1887 to 1895 numbered 2,918; the resignations and deaths removed 862, leaving a net gain of 2,066. He ventured to think that in face of those figures it could not be contended that the Society had forfeited the confidence of the Horticultural world or of its Fellows. He could assure the meeting that the Council had done its very best for the good of the Society, and they trusted that the Fellows would endorse the policy they had adopted.

Mr. F. ROWLEY PARKER seconded the adoption of the report.

AN AMENDMENT.

Mr. A. H. Smeë said he regretted to be compelled to move an amendment to the resolution. He generally felt it his duty to support the Executive, and he believed the Council had endeavoured to do their best for the Society; but he thought there were times when they deviated a little from their powers. He then went on to say that the Council had acted *ultra vires* in granting a retiring allowance to Mr. Barron. It should be remembered that the Society was a voluntary society, and if any accident happened to it, he took it that the Fellows would be responsible for the pension. The report stated that Mr. Barron had had conferred upon him an Honorary Life Fellowship of the Society, but no such Fellowship was mentioned in their charter, and there was no such thing. If they had elected Mr. Barron an ordinary Fellow he would have come under Rule 90, and under that rule it would have been impossible for the Council to have conferred a pension upon him. He did not accuse the Council of wilfully doing wrong, but they were bound by their charter. Before bringing the matter forward he had taken the advice of counsel; and his amendment was as follows:—

"An allegation having been made by a Fellow that the Council may have acted *ultra vires* to its charter, and the bye-laws by electing Mr. Barron to a Life Fellowship, and that the form of ballot-paper and mode of election, and removal of members of the Council, is irregular, and a doubt is expressed that the meeting is incapable to deal with the allegations, it is expedient that a committee of seven Fellows shall be appointed to investigate and report on these allegations, and they be empowered to obtain legal advice on the subject and to report to an adjournment of this meeting."

Mr. Smeë added that he would, if desired, hand his "counsel's opinion" to the Council.

The President: "We don't want your counsel's opinion. That depends on the case put before him." Continuing, the President said they could not accept any such proposal as that contained in the amendment. The Council had acted in accordance with the custom that had been pursued ever since he had had the honour of being connected with the Society. He confessed that he believed it would be a total waste of the time of the seven members who might be appointed to the committee, and of the money which he supposed the Society would have to pay for counsel's advice. He sincerely trusted the meeting would, in the interest and welfare of the Society, give an emphatic negative to the amendment.

Mr. HENRY A. HARRIS said he did not wish to support the amendment; but it [the present practice] rather amounted to the Council electing their successors.

The amendment having been seconded, it was put to the meeting when only three voted for it. It was thus lost by an overwhelming majority.

Mr. Smeë said he was afraid he should have to stop the Council by an injunction.

The President: You must take whatever course you think proper.

The President then said that Mr. Barr had handed in a number of questions. I confess, continued the President, that it is with a feeling of shame that I feel called upon to read these questions. They are an attack upon an officer of the Society who has served the Society in a way that no officer has served the Board in the past. When we remember the cheerfulness, the courage, and the resolution of our Secretary while labouring under a severe physical disablement, in carrying on the duties of his office, and the way he devoted himself to the service of the Society during that severe illness, I could use language, in regard to these questions, which the reporter would not take down.

Baron Schroder said he did not intend to speak that day, but after the attack upon his excellent friend the Secretary, and upon the Council, he felt that he could not sit still. He thought he could speak with some authority, as he had been on the Council for many years. He joined the Council of the Society when the Society was in a very bad way, when they were like a cock-pit, and when they were financially ruined. Since then they had had the advantage of getting rid of a good many members of the Council who were obnoxious, and of getting a Secretary instead who was a man for whom they all had the greatest respect, and a man the like of whom he had very seldom found in the long life he had lived—a man who had filled his position with great honour, great integrity, and a great knowledge of the subject. He hoped they would unanimously record their appreciation of those qualities, and not allow their Secretary to be slandered. After the most painful scene they had just witnessed, he thought it was their duty to record a Vote of Confidence in the Council, in their President, in the Secretary, and in the Officers of the Society.

Mr. HARRY VEITCH said he had the very greatest possible pleasure in seconding the proposal. It had not been his good fortune to have sat so long at the Council table as some, but he had sat there sufficiently long to know the valuable—the invaluable—services of Mr. Wilks. He (the speaker) was one of those who joined in the fight against the then Council at South Kensington, when they had the gratification of ousting many of them, and it was at that time that Mr. Wilks joined the Council. He heard the question asked as to what were the official hours of the Secretary. He believed that not only had Mr. Wilks devoted his week-days to the

Society, but he believed he had given to it some of his Sunday hours. He had never addressed an enquiry to Mr. Wilks without getting an answer, and Mr. Wilks never allowed a single point to go undecided. It was very seldom they found clergymen with the business habits of Mr. Wilks.

The President put Baron Schroder's vote to the meeting. It was carried unanimously—"even these gentlemen by me," adding the Baron, "voting in its favour."

The President said he was very much obliged for the vote. In conclusion, he asked the meeting to pass a hearty vote of thanks to all those who had co-operated with the Council in carrying on the work of the Society. The gentlemen who composed the several Committees were most eminent in their branches of horticulture, and they gave valuable services at very great inconvenience to themselves. The vote was carried.

The Secretary, who was received with loud cheers, said he would very much rather have sat perfectly silent at that meeting, because it was almost as painful for him to have to listen to such exceedingly kind and almost undeserved words that had fallen from the Baron and from Mr. Veitch, as it had been to listen to the sort of catechism which Mr. Barr had put the President through. One was almost as painful as the other, but at the same time one was very gratifying, and the other was the reverse. The opposition they had had to meet during the last few minutes was in itself a source of gratification, as he would ten thousand times prefer that gentlemen should come to their meetings and say out what they meant, instead of following the course pursued in such matters by a kindred society. When the Society was criticised, it was doing good work. He thanked them very much for the vote of confidence.

The President mentioned that Mr. Wilks acted as Secretary to the Society for several years without any payment, and it was only when he felt he was obliged through circumstances to take any payment, that he did so.

Mr. MARSHALL enquired what was to be done at Chiswick, to which the reply was made that no answer could be given, but that a "free hand" would be allowed to the new superintendent.

Mr. R. DEAN said he noticed that there would be no meeting of the Floral Committee between an early date in September and the beginning of October. He thought there should be a meeting sooner.

The President promised that the matter should not be lost sight of. He then formally moved the adoption of the Council's report. The motion was carried.

DEVON AND EXETER GARDENERS' ASSOCIATION.

FEBRUARY 5.—The title of the lecture given at the last meeting was "The Cultivation of Vegetables," and the lecturer was Mr. T. H. SLADE, gr. to Lord Poltimore, of Poltimore Park.

Dealing first with Potatoes, Mr. SLADE recommended deep or double-digging, giving the plants plenty of space each way, and a frequent change of seed, especially seed from a different kind of soil. Brassicas, and especially Broccoli and Cauliflowers, were better able to withstand frost when planted on hard ground which had been deeply dug and well manured the year before. He recommended them to be grown in breadths, and, in the discussion which followed, it came out that these crops stood a hard winter better when well exposed on high ground than when in more sheltered positions. Model Broccoli he held to be a model in more than its name, as it combined good size with high quality, and protected itself well by its inner leaves. Peas, he said, did best on strong land, and, as a rule, good Wheat-land made good Pea-land. Mentioning the best varieties, such as Etonian, Duke of Albany, Main Crop, Stratagem, Autocrat, and others, Goldfinder came in for a large share in the discussion. It seemed to be a sort particularly well-adapted for Devonshire, in which county it was first selected, and it was generally considered as the best of the No Plus Ultra type. Onions wanted fairly deep soil, well worked and manured in the autumn, re-dug and trampled down before sowing. Mr. SLADE warned his hearers in testing new sorts of vegetables, not to be too loud in praising nor too hasty in condemning on the result of one season's trial. Discussing the question of garden manure, it was shown that fish manure or any manure rich in potash was the most generally useful for gardens. K unit was said to be well worth the price it was generally sold for, and, in conjunction with superphosphate of lime, a valuable manure for Potatoes. Wood-ashes, the remains of burnt rubbish heaps, was a valuable manure, as it both enriched and lightened heavy soil, and rendered it more porous.

A very useful discussion ensued at the conclusion of the address, and the meeting ended with a hearty vote of thanks to Mr. SLADE for his lecture, given extempore; and to the chairman, Mr. HILL, Market Gardener, Whipton, for presiding.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

A QUESTION OF RATING.—I have applied to the Assessment Committee for reduction of tax on my market garden, according to the trial reported in

the *Gardeners' Chronicle*, and also in the "Answers to Correspondents." The committee assert that the reduction of assessment to one-fourth applies only to sanitary rates, and not to the assessment for other taxes, which, if so, does not apply to the majority of country gardeners, who, outside a town, have no sanitary rate. Can you tell me if this is so, and if not what steps I can take to enforce the reduction. While writing, I should like to call your attention to the extremely unfair position of market gardeners in regard to assessment, in relation to other people. The tradesman uses his capital in buying stock, on which he pays no rate; the clerk, with an income of £150 pays no rate, except for the house he lives in; but the market gardener who invests his capital in a greenhouse, is straightway mulcted of a rate for the same. In the case of no other trade, I believe, is the tradesman rated for anything but his dwelling-house. Can you tell me if there is any appeal from the Local Assessment Committee, E. A. C. [Our correspondent should apply to Mr. S. Worrell, secretary to the Nursery and Seed Trade Association, 30, Wood Street, Cheapside, E.C. Ed.]

MIGNONETTE.—I planted Mignonette in a border in a greenhouse over two months ago. It hardly grows at all. Can you tell me the best manure for it, or anything which will conduce to its growth and blooming, E. A. C. [As sunlight increases, the plants will probably grow. In its present stagnant condition we should not apply manure. Ed.]

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

NOTICES TO CORRESPONDENTS.

AGREEMENT WITH REGARD TO BUSINESS SALES: C. G. H. It should be ascertained if B. has any intention of continuing to trade within the prohibited radius, or if he is merely getting rid of trees, &c., for which he has no further use. The case seems to be one that might well be settled by a mutual friend or by an impartial arbitrator.

AMERICAN GARDENING PAPERS: A. D. We cannot say which is the best; *American Gardening and Garden and Forest* are good ones. Enquire of any foreign bookseller. Of Columbian and South American gardening papers we know nothing.

AQUILEGIA SKINNERI: H. C. You will find what you want in Mr. Baker's Monograph of Cultivated Aquilegia in *Gardeners' Chronicle*, vol. x., 1878.

ASPARAGUS: G. J. The beds having been dressed anew with manure, line them out to their original width, chopping down the sides with the spade, and throwing some of the soil from the alleys to the right and left, patting and smoothing it at the sides as you would earth-up Celery, throwing a little of it, say about 2 inches thick on the top of the beds. When this soil has become pulverised by wind, frost, and rain, which may occur in about a month, rake the beds smooth, and give them a rounded contour.

BOOKS: *Reader. Orchids for Amateurs*, by Jas. Britten and W. H. Gower; published at 170, Strand, W.C.—A. B., *Hants*. The best is *The Orchid Hybrids*, by Haasen, published by Dulau & Co., Soho Square, London.

BORONIA PROPAGATION: M. W. The cuttings of Boronia, like other plants belonging to Rutaceæ, should, in a general way, be taken from shoots which are mature, or approaching that stage; they should be cut through at a joint, and placed under bell-glasses with a hole in the top, and kept in a cool, airy house. Boronia serrulata, and probably B. megastigma, should be got into growth a little—say, put into mild heat for a month or two, the young tips of the shoots taken, no leaves being removed, and stuck into sandy peat, with an upper layer of the cleanest sand, covered with a bell-glass, and put in the propagating-house; but no

bottom-heat should be afforded, and not much water. B. pinnata does best when grafted on some freer-rooting species; B. alata, B. denticulata, and B. serrulata, if struck from ripe shoots, should have a length of 2 to 4 inches, and be struck cool.

CAMELLIA: R. O. Variegated Camellias are, we believe, in the trade; at any rate, we occasionally see them.

CARNATIONS: F. Webber. We cannot find any grubs in the plants sent, but from your description the insect is probably the "Carnation-fly," several times alluded to in this journal in the course of the last two or three years, R. McL.

CELERY LATE IN THE WINTER: Vegetarian. Plant some dwarf-growing variety, as Major Clarke's Red, or Sandringham White. The seed should be sown at the end of the month of March or in April, and treated hardily from the first, pricking off the plants before they get in the least degree crowded. The soil being wet, plant in very shallow drills, or on the level, and mould up by the end of November to about one half its height. In hard weather give protection by means of litter or bracken, and in February dig it up and lay-in in a north border close together, and as high up the stems as the heart leaves go.

DENDROBIUMS AND CATTLEYAS: A. D. The growths of the first in a state of nature are mostly pendulous or prostrate; of the second, erect or not, according to position.

DOUBLE DAFFODILS: J. A. O. The flowers sent are those of the common Double Daffodil (*Telamonia plenus*). These often come green, and are, indeed, very variable.

HOLLY HEDGE GETTING BARE AT THE BOTTOM: X. Y. Z. Short of cutting back the plants in the bare parts to half their height, you should keep the upper portion of the plants severely cut in as regards their lateral shoots for a season or two, permitting all shoots which issue from the lower parts of the stems to grow unrestrained for two or three years; even layering of the more conveniently placed lower shoots might be attempted, employing some fresh friable soil about the layers, and covering the ground with leaves, moss, or manure, to a depth of 2 or 3 inches.

INSECT: W. Cann. The grub of the Daddy-longlegs, *Tipula oleracea*.

LAWN DRESSING: W. Dawson. If the land is light, employ heavy loam finely sifted two-thirds, to one-third wood-ashes, or failing the latter substance, stable-dung in a thoroughly rotten condition; and if the lawn is bare of grass in places, sow "lawn grass" seeds in mixture on such places after scratching the surface with an iron rake, and beating or rolling the seed into the dressing. For heavy land, make use of wood-ashes, charred soil, sea-sand, soil from beneath the potting-bench, and if it be poor, at the least half of the whole should consist of rotten dung. Fish manure is an excellent dressing for grass land, but it should be applied when the family is absent from home for some weeks.

LIME AND VINE MANURE: J. A. The dressing of quick-lime need not be a "very slight one," but it should quite hide the soil from sight. The "Vine-manure" might be used two or three months later, or it may be given first, and slightly buried with the digging-fork.

MUSHROOM CULTURE: G. E. B. E. Apparently you are not acquainted with the rudiments of the art of growing Mushrooms; and the subject needing more space for its explanation than we can afford, we should strongly advise you to obtain a manual on the subject, such as *Mushrooms for the Million*, by J. Wright, 171, Fleet Street, E.C.

NAMES OF FRUITS: *Persicus*, I. Cocker Pippin; 2, Scarlet Russet.—A. Eyerly. Gloria Mundi.—Cockerell. Gloria Mundi.

NAMES OF PLANTS: *Reader*. *Cryptomeria japonica*.—A Lover of Orchids. *Cattleya Trianaei*, a very fine variety, near to C. T. Backhousiana; the other is a fairly good variety of *Lycaste Skinneri*.—A. E. H. The pseudo-bulb seed appears to be that of a *Bletia*, most of the species of which are easily cultivated in a cool or intermediate plant-house. B. hyacinthina is hardy in favourable situations. Some of the *Eulophias* have growth similar to that sent.—C. W. C. One of the Alders (*Alnus*); we cannot tell which, in the absence of leaves.—S. Maddox. *Streptosolen Jamesoni*.—C. C. Not a Snowdrop, but a Snowflake, *Lencium vernum*,

*Ooontoglossum Uro-Skinnei*: T. B., Leeds. Your undescendance of more than 4 feet in length, and which has been in flower since August last, is a very extraordinary ooe.

PEAR-SHOOT BORED: T. C. The work, probably, of the larvae of the Wood-Leopard Moth.

PELAGONIUM LEAVES DISEASED: X. Y. Z. The disease is caused by the presence of too much moisture at the roots, and the temperature of the soil being nearly that of the air. Give more ventilation. G. M.

PITCHER-PLANTS AND INSECTS: O. A. The bodies of captured insects and small creatures serve in some way—probably by the absorption of liquid-manure derived from the decaying remains to nourish the plants. The pitchers seem to be ordained to furnish an ever-present means of destruction in the plant's proper habitats, for insects which might by their excessive numbers disturb the balance of life in those parts of the world. The older pitchers in *Nepenthes*, *Sarracenia*, and other genera, are often full of water, secreted by the plants; at any rate, it helps to kill by drowning those insects which may have crept into the pitchers, and whose return is almost invariably frustrated by the smooth interior surface and fence of downward pointing stiff hairs.

TECOMA SMITHI: T. C. H. Do not overpot the plant; keep it under glass till it has made its growth, or most of it, then stand it out-of-doors in the full sunshine, or in a sunny pit or frame, taking care that worms do not get into the pot; syringing it occasionally in hot weather, and affording no manure-water. The plant will bloom in the young state.

TUBER OF RICHARDIA ETHIOPICA: R. K. B. The tuber has the appearance of having been gnawed by wireworm, but none of these creatures could be found in the package or on the tuber.

VINES IN PLANT-HOUSE: F. A. W. The Vines being so bad, it will doubtless be better to cut the rods back to a point near the ground-level, and if the old Vines are not too close, to plant new Vines between them in new soil. Select the best one or two canes which break from each old rod, and let them run without stopping them, or denuding them too severely of the laterals. The roots should be examined, and some good loamy soil got in, together with charcoal, crushed bones, and Vine-manure, in which the roots, or some of them, should be laid. The outfall for the water falling on the border should be examined, and put in order if found faulty. In the autumn, the work of thoroughly renovating the border may be undertaken. Keep the border for the Vines alone, and let the plants grown in the house be secondary to the Vines as far as may be.

VITIS COIGNETIE, PROPAGATION OF: X. Y. Z. This is a very difficult plant to increase from cuttings, and the only likely method is to use for the purpose wood which is nearly or quite matured, and three or four joints in length, cutting them straight across just below a node. If this be done in October, the cuttings should be put into porous sandy soil under a cold frame or hand-glass, placing them in another similar bed in a sheltered part of the garden unprotected by glass. Only one bud should show above the ground-level, and the soil made firm about them, making sure that the bottom of the cuttings rests firmly on the ground at the bottom of the hole. Layers would be more certain to root, especially if the bark be notched half-way round the shoots, and close below a bud or node, or if a wire be tied fast around them in the same place. Splitting the layered shoot for the distance of two nodes might facilitate the rooting process. We believe Mr. Thomson, of Taverner Street, Ipswich, offers seeds of the plant. Where a few plants only are wanted, grafting by approach (inarching) on any hardy Vine would probably be a better way.

# SPRING CAMPAIGN

## ATTACK ON THE PROVINCES.

NORTH, SOUTH, EAST, WEST. IN EVERY PART OF ENGLAND.

THE rapid strides made during the last few years in horticultural pursuits, and the constantly-increasing demand for Greenhouses (by which alone success in the perfection of floral beauty can be maintained) has induced Messrs. W. COOPER, Ltd., PIONEERS OF CHEAP GREENHOUSES FOR THE MILLION, to extend their operations in a way that will tend to encourage and further develop the art of floriculture in every part of England. THE FOLLOWING ADVANTAGEOUS TERMS ARE OFFERED FOR ONE MONTH ONLY:—

- 1.—All orders to be sent in before March 14, after which date no order will be booked below list prices.
  - 2.—A deposit of 10 per cent. to accompany all orders, the balance to be paid to our foreman in charge of job upon completing erection, and price to be strictly Net.
  - 3.—All houses will be complete as mentioned below, and painted two coats of good oil-colour at our works, and delivered free of any charge to your nearest station, erected and glazed complete.
  - 4.—Customers to advise us immediately upon arrival of goods at their station by telegram, and to cart same, at their own expense, from station on to site, ready for erection, within 24 hours after arrival.
  - 5.—Customers to have all ground cleared and level for our men to erect.
  - 6.—Our men erect and glaze house complete and ready for use, free of any charge outside prima cost of house.
  - 7.—We do not bind ourselves to erect on any particular date, which must be left entirely to us; but shall not exceed one month after date of arrival.
  - 8.—We reserve to ourselves the right to refuse any order or orders that may be sent in upon these terms.
- N.B.—Prices quoted for Heating Apparatus are only on condition that we supply the house as well; on no account could we deliver and fix Heating Apparatus at these prices without order for house, although we are prepared to fix houses without heating apparatus.

### AMATEUR SPAN-ROOF GREENHOUSE.

TENANT'S FIXTURE.

This Greenhouse is made especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but not expensive structure, and being constructed in complete sections.

The framework is substantially constructed of red deal, the lower part being filled in with good, sound, well-seasoned, tongued and grooved matchboards. The house is fitted with door, complete with rim-lock and brass furniture, painted two coats of good oil colour, supplied with all necessary ironwork and stages for each side, and good 16 oz. English-cut glass throughout.

Carefully packed and delivered carriage paid to nearest station, and erected complete, at the following respective prices:—

Long.	Wide.	High.	To Eaves.	Erected Complete.

100ft. ...	10ft. ...	9ft. ...	5ft. 6in. ...	70 0 0

### THE AMATEUR FORCING-HOUSE.

TENANT'S FIXTURE.—SPAN-ROOF.

These Houses are offered at an exceedingly low rate, and should be readily approved by both amateur and professional gardeners, as brickwork, which is very expensive to a small house, is entirely dispensed with.

The utility of such a house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown.

Specification.—Framework substantially constructed of red deal, the whole of sides, and 2 ft. 6 in. of ends, hoarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim-lock and brass-fittings, in one end; glass 16 oz. throughout, English cut. Ventilators supplied according to size of House, and stays necessary for opening same; stages for plants each side of House; all woodwork painted two coats of good oil paint, and the whole structure securely packed and delivered carriage paid to nearest station, and erected and glazed complete, at the following respective prices:—

Length.	Width.	Height.	Erected complete.	Length.	Width.	Height.	Erected complete.
7ft.	5ft.	7ft.	£4 0 0	15ft.	10ft.	8ft. 6in.	£11 0 0

12ft.	8ft.	8ft.	7 10 0	130ft.	10ft.	9ft.	65 0 0

### SPAN-ROOF VILLA CONSERVATORY.

This House is adaptable for the lawn of a villa residence, being well and substantially built, constructed of the best materials, and artistically finished, with diagonal panels. The framework is composed of 2 in. by 3 1/2 in. red deal, the lower part doubly-lined with tongued and grooved matchboards, and the roof properly fitted with sashes, which facilitates fixing or removing of same without disturbing glass.

The house is fitted with a half-glass door, complete with rim-lock, brass fittings, and key, and is supplied with lattice staging for each side, footpath the entire length of house, gutters, down-pipes, top and side ventilators, according to size, and necessary ironwork for opening same. All woodwork painted two coats of good oil-paint, glass cut to sizes, and all parts securely packed and delivered carriage paid to nearest station, and erected complete, at the following respective prices:—

Long.	Wide.	High.	To eaves.	Erected compl.	Long.	Wide.	High.	To eaves.	Erected compl.

# STANDEN'S MANURE.

ESTABLISHED OVER  
30 YEARS.

Exceeds all others in General Fertilising Properties and Staying Powers.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell. The highly-fertilising properties of this Manure render its money value, in comparison with other Manures, at least double, and users will find that very small quantities will produce favourable and lasting results.

**COMMERCE, WITH ITS SPREADING WINGS**, has traversed the globe many times, and binds nations together with the strong ties of mutual self-interest. Through its influence London has become the metropolis of the world, and her merchants have amassed wealth sufficient to make them the envy of princes. **HOLLOWAYS PILLS and OINTMENT** have now become essential articles of commerce with all parts of the world. They have effected cures which have seemed miraculous, and given relief to complainants when all hope had been lost. In all known diseases their success has at all times been wonderful. In cases of disorders of the stomach, bile, liver complaint, indigestion, fevers, ague, &c., they act like a charm, as the cure is speedy and certain.

**OLD CATTLEYA LABIATA**

MESSRS.

**PROTHEROE & MORRIS**

67 & 68, Cheapside, London, E.C.,

HAVE RECEIVED INSTRUCTIONS FROM

**F. SANDER & CO.**

To Sell a wonderful new importation of this unrivalled and unapproachable type of

CATTLEYA LABIATA,

**SWAINSON'S TRUE OLD TYPE,**

Producing the large brilliant varieties.

THIS WILL BE THE SALE OF THE SEASON.

FRIDAY NEXT, February 28, 1896.

**Friday Next, February 28.**

Great Sale of the

**OLD CATTLEYA LABIATA.**

MESSRS. PROTHEROE and MORRIS have received instructions from Messrs. F. SANDER & Co., St. Albans, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, February 28, the whole of a large consignment of SWAINSON'S OLD CATTLEYA LABIATA.

Sander's Red and White Type,

Unrivalled and unapproachable, producing the large brilliant varieties.

The plants are in magnificent order, their condition could not be finer. The varieties are endless, the form and colouring superb, embracing white, rose, red, purple, maroon, and yellow. The plants are fully described in the Catalogue.

Also 40 Plants (established) of the Great White LÆLIA-LIKE DENDROBE D. JOHNSONÆ.

VANDA HOOKERIANA GIANTEA,

By far the finest form of this superb species; flowers white, rose and amethyst-purple lip, broadly fan-shaped, beautifully crested.

DENDROBIUM CRASSINODE, D. EBURNEUM? The plants were sent home by our Collector as being snow-white and vermilion flowered.

DENDROBIUM PHYCRANUM, D. DIXANTHUM, D. DENSI-FLORUM, and D. SPECIOS, from Upper Burma.

CYPRIPEDIUM SPECIES, from the Dokela Mountains, apparently a form of C. Parishii.

CYPRIPEDIUM SPECIES, from Burmese frontier, found growing with C. insignis and C. Charlesworthii, possibly C. Parishii, but more resembling C. levigatum; neither have been seen in flower. Also

THUNIA HENSONIÆ, &c., &c.

On view morning of Sale, and Catalogues had.

**"Rooklands," Torquay.**

SALE of the Collection of well-grown ESTABLISHED ORCHIDS, comprising about 450 Plants. Also the Glass Erection, &c. By order of the Executors of the late Morton Sparke, Esq.

WITHOUT RESERVE.

MESSRS. PROTHEROE and MORRIS are instructed to SELL by AUCTION, on the Premises, "Rooklands," Torquay (entrance in St. Michael's Road), one minute's walk from Torre Station, and one mile from Torquay Station, on WEDNESDAY, March 4, at Half-past Twelve o'Clock, the Collection of well grown

**ESTABLISHED ORCHIDS,**

Among which will be found the following:—

Cattleya exoniensis	Cyclogyne Massangeana
Cypridium Rothschildianum	Dendrobium nobile nobiliss
" Stonei	" densiflorum, extra fine
" Curtii	" Brymerianum
Cymbidium eburneum	Orammatophyllum Ellisii
" Mastersii	Lycaste Skinneri alba
" giganteum	Sobralia xantholeuca, 2 plants

Also the STOVE and GREENHOUSE PLANTS, in variety, three Greenhouses, 36 feet by 20 feet, 20 feet by 12 feet, and 30 feet by 13 feet; 830 feet of Hot-water Piping and the Brick-work; Galvanised Tank, Rockwork, Tubular Boiler and another; two Pigeon-houses, Hen-house, Tortoise Stove, Gas Stove, &c.

May be viewed two days prior and morning of Sale. Catalogues may be had of Mr. T. Brockbank, the Head Gardener, on the premises; and of the AUCTIONEERS, 67 and 68, Cheapside, London, E.C.

**LLOYD'S PERFECTED 'Pennsylvania'**

**AMERICAN LAWN-MOWER.**

"We strongly recommend the 'Pennsylvania.'" —Fald.

World's Fair, Chicago, Highest Award. Paris International Exhibition, Highest Award, Silver Medal. NO AWARD WAS GIVEN to any English or Continental-made Lawn Mowers.

**THE "PENNSYLVANIA"**

IS THE Perfection of EASY WORKING and EFFICIENCY.

THE ONLY AMERICAN LAWN MOWER fitted with Six Cutting Blades.

**THE "PENNSYLVANIA"**

IS THE

**MACHINE**

FOR GOLF LINKS.

Above illustration shows the machine as it appears when **OUT OF GEAR**, and in the proper position for running it easily from one place to another, over gravel walks or rough and uneven ground. When moving it in this way there is no unnecessary wear of the driving pinions, all risk of damaging the cutting knives is avoided, and the machine can be pushed over the ground with very little labour—a great advantage in extensive gardens, but especially on GOLF LINKS.

Gardeners who have once tried the "Pennsylvania" Lawn Mower, will use no other.

**THE "PENNSYLVANIA."**

CARRIAGE PAID TO ALL STATIONS.

**THE "PENNSYLVANIA."**

ONE MONTH'S FREE TRIAL ALLOWED.

**TESTIMONIAL—**

"World's Columbian Exposition, Chicago, October 16, 1893.

"Gentlemen,—I desire to state that we have used the 'Pennsylvania' Lawn Mowers almost exclusively during the progress of the Fair, with the most satisfactory results. The ease in working them was remarkable, and they did more work than we supposed was possible for Lawn Mowers to accomplish. The appearance and condition of our lawns, in comparison with others, prove the high grade and superiority of these Lawn Mowers.—A. B. FARQUHAR, Executive Commissioner."

AGENTS WANTED

**XL ALL LIQUID INSECTICIDE,**

(PATENT),

For Syringing, Dipping, and Washing Plants and Fruit Trees.

Manufactured in Bond, from pure Nicotine of Tobacco, by special permission of the Hon. Board of H.M. Customs.

**ADVANTAGES CLAIMED—**

It is always of uniform strength, and perfectly safe when used as directed. Kills every insect which affect Plants and Fruit Trees. Does not stain Foliage, Flowers, or Fruit. A clear Liquid (no sediment), bereft differing from the crude, thick, soapy preparations frequently recommended. Being the Strongest in the Market, it is cheap in use, standing twice the amount of dilution of any other safe preparation. As an example, Kills Fly at 1 to 40 parts of water.

1 Pint, 2s.; 1 Quart, 3s. 6d.; 1-Gallon, 5s.; 1 Gallon, 10s.; also in 4 and 6-Gallon Drums.

To be had from all Nurserymen, Seedsmen, and Sundriesmen; or direct from the Manufacturer and Patentee—

**G. H. RICHARDS,**

Old Shot Tower Wharf, Lambeth, London. S.E.

Telegraphic Address—"Vaporizing, London."

**BENTLEY'S Prize Medal INSECTICIDE.**

USED BY THE LEADING GARDENERS.

1 pint, 2s.; 1 quart, 3s. 6d.; 1/2 gallon, 5s.; 1 gallon, 9s. 3 gallons, 24s.

**JOSEPH BENTLEY,**

CHEMICAL WORKS, BARROW-ON-HUMBER, HULL.

**LETHORION (Vapour Cone) PATENT.**

The total destruction of Insect Pests in Greenhouses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. It CANNOT fail where the houses are secure. Red Spider, Scale, and Mealy Bug can be easily eradicated by doubling the Cone power.

PRICES: For frames, &c., of 50 to 100 ft., 6d.; 500 to 700 ft., 9d.; 1100 to 1500 ft., 1s.; 4000 ft., 3s. 6d.

The public are cautioned against imitations in various forms at less cost, as they have in most instances proved to be worthless articles, totally unequal to Lethorion in strength and effect.

 THE VINEYARD AND NURSERIES, GARSTON, NEAR LIVERPOOL.

# HUMULUS LUPULUS

(PERENNIAL).

The Quickest, Hardest, and Prettiest CLIMBER in the World.

The *Bazar*, *Exchange and Mart*, Dec. 30, 1895, writes:—  
 "Comparatively few seem to be aware of its value as an ornamental plant, or it would assuredly be oftener found in our gardens. Its foliage is of a lovely green in early summer, changing gradually as autumn comes; while its graceful panicles of greenish-yellow flowers afford a pretty contrast. Not the least desirable of its many recommendations is its perennial character, for when once planted, it seldom needs replenishing. ITS FIRST COST MAY THEREFORE BE SAID TO BE ITS LAST.  
 "There are many objectionable spots in gardens that might be rendered at least pleasing to the eye by means of this plant. No particular soil is required to grow it, though a deepish loam is conducive to its well-being."

## PLANT HUMULUS LUPULUS AT ONCE.

This year will cover walls, fences, verandahs, arches, porches, trellis-work, houses, and unsightly buildings of any description. Can climb 20 feet in one season, increasing yearly. Grows anywhere or anyhow, on wood, wire, or string.

- 6 Plants (2 named varieties), P.O. 3s. Flowering August and September.
- 12 Plants (4 named varieties), P.O. 4s. 6d., Flowering August, September, & October.

### SPECIAL OFFER.

- 36 Plants (12 named varieties), P.O. 10s., flowering in succession, July, August, September, and October.

Full Instructions for Planting and Growing sent with every Order. All Plants Carriage Paid.

# Williams'

## NEW GIANT PRIMULAS.

### PRIMULA SINENSIS FIMBRIATA "Magnum Bonum," Red (Sterling Novelty for 1898).

The plants are very sturdy and compact in habit; the flower-stem is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, are of a gigantic size, beautifully fringed, and the colour is a very beautiful shade of a rich deep red. Per packet, 5s.

### PRIMULA SINENSIS FIMBRIATA "Snowball," White.

It is vigorous in growth, the foliage being remarkably strong. The flower-stem is very sturdy, rises well above the foliage, and bears a profusion of massive flowers of a pure white colour of great substance. The individual blooms measure 2½ inches in diameter, and are exquisitely fringed. Per packet, 5s.

From Mr. WALTER BESWICK, The Gardens Palm House, Manchester:—"I took Six First Prizes with your superb strain of Primula last November."

Illustrated Seed Catalogue for 1898 is now ready, and will be forwarded gratis and post-free to all applicants.

Distinct Novelty

## HARDY PRIMROSES

(As exhibited at the Royal Horticultural Society's Meeting, February 11).

### From LIGHT BLUE to DEEP PURPLE.

Per Packet, 2/6.

### PRESS REPORTS:—

From the *Gardeners' Chronicle*, February 15, 1896:—"Messrs. Jas. Veitch & Sons made a large exhibit of their Blue-flowered Primroses, seedlings from the stock raised by Mr. G. F. Wilson. The plants were in pots, and carried numerous flowers containing many degrees in the character of the blue, which in some cases may be described as purple-blue."

Per Packet, 2/6.

The *Garden*, February 15, 1898, says:—"One of the chief features before the Floral Committee was the Blue Primroses from Messrs. Veitch & Sons, which made a fine display."

Per Packet, 2/6.

The *Journal of Horticulture*, February 13, 1898, says:—"Messrs. Jas. Veitch & Sons sent a group of pretty Blue Primroses, from a strain raised by Mr. G. F. Wilson; the flowers vary in shade from light blue to almost deep purple, and are produced in large numbers on sturdy footstalks."

Per Packet, 2/6.

From the *Gardeners' Magazine*, February 15, 1898:—"Blue Primroses from J. Veitch & Sons, Chelsea, were much admired, and constituted quite a feature of the show."

Per Packet, 2/6.

## ANCIENT ROSES.

WE dare say that it has often occurred to many a lover of the Rose, who remembers what is said of the profusion with which the flower was used at Roman festivals, and the praises which were so lavishly poured upon it, to ask, what were the kinds of Roses that were used or misused, as the case may be, on such occasions? or, again, when he turns to his, alas! too often neglected Virgil, what was the poet's meaning when he wrote in the Georgics the praises of the Pæstum Roses? Did they really have any hybrid perpetuals in those days? Could they have got up an exhibition? or was there anything that they had which is beyond our reach in these days? We know that we can never match the architects of Greece and Rome, nor produce any statues like the Venus de Medici, the Dying Gladiator, or the Laocoon; but was their Rose culture as successful? The whole question has been carefully entered into in a scholarly article in the July number of the *Quarterly*, 1895, written evidently by one who is not only a classical scholar, but a good Rose grower. It is, we believe, an open secret that the Rev. George Jeans, of Shorwell, in the Isle of Wight, is the author, and we must congratulate him on the able and thoughtful manner in which he has treated the whole subject, under the title of "Ancient Rose Growers." We have thought it well to draw the attention of Rose growers to it, and because we wish them to read it for themselves, must take only a cursory view of it. He is justly severe on writers who glibly quote Anacreon, Sappho, &c., of whose writings they have, perhaps, never read a word, and only follow what some preceding writer has said. We are so accustomed to regard the Greeks as our masters and teachers in so many things pertaining to art, that we might have hoped to have found something worth recording with regard to their efforts in the cultivation of the Rose; more especially as there is little doubt that we owe probably its introduction in our western gardens to Persia, or some neighbouring country. Here is what the essayist says on the subject:—"A Greek under the hot sun of the south, and living on the dusty limestone of Athens or Corinth, desired, above all things, in his pleasure-garden shady trees to walk or lie under; and there is nothing that the Rose abhors so much as hot raging tempests or biting frosts (within reason), as the dank shade and the greedy roots of trees. If he wanted flowers at all, it was probably only for a garland to tie round his head over his wine, as the budding Senior Wrangler ties the wet towel round his head over his green tea. The few flowers that he cared about having at all found their place, therefore, mostly in the unshaded kitchen garden; and a very odd passage in Plutarch throws considerable light on the state of Greek horticulture, by telling us of the juxtaposition

by good gardeners of their Rose and Violet beds with the rows of Leeks and Onions, which suggests, as Bekker says, "that both were equally wanted for cutting, not for garden decoration." But if it was so with the Greeks, it was very different with the Romans in the luxurious times of the empire, for, as the writer justly observes, grim old senators who moulded the destinies of the public, had no time to give to such trifles; but from all sides when the empire was established, and when luxury succeeded to the sterner republic, the whole case was altered. We have writers dwelling upon the culture, as well as others singing of the beauty of the Rose. Here is what the writer says:—"The luxury of the Roman Empire created the first great development of the cultivated Rose. Lower motives may lead to refined results, as Carlyle used to insist. The first wreath, which seems to have been to a Greek the final cause of Roses, is said to have been only a glorification of the tight string tied round the head to avoid the next day's headache! Thus, for example, the great Varro, though he was as omniscient as our own Bacon, and wrote most elaborately on cultivation, as well as everything else—*de omnibus rebus et quibusdam aliis*—still seem to think of Roses as propagated only by cuttings—that is, on their own roots; a method in which no great advance in the perfection of blooms is possible." It is somewhat curious thus to find that many of the practices which prevail amongst Rose-growers now can date back to those far-off times. Roses were budded then as they are now, the stock that was used being the Wild Rose, just as the Dog Rose was for a long time the only stock used amongst us. There were many fanciful attempts to make plants of other genera useful for this purpose, just as nothing would persuade some of the people in our country-districts that the dark-coloured flowers have not been obtained by the union of the Black Currant with the Rose. It has been an age for trying experiments, but we should imagine that ninety-nine out of every hundred of Roses have been budded on either the Briar or Manetti (quite a modern introduction). It is at this time of the Roman empire that we read of the extravagant use of Roses at Roman festivals, and the writer has some interesting statements upon this subject. We have wondered at the extravagance which could spend £1000 or more on Roses for a great occasion; but this fades into insignificance before the £30,000 spent at a banquet given to that horrible monster, the Emperor Nero—although the writer throws considerable doubt upon the whole passage in Suetonius, where this statement occurs. If it be in any way true, the market for cut Roses must have been tolerably active at Rome. And now comes the question: where were the Roses grown, how were they conveyed to the great city, and what were the sorts? With regard to the first, there were no doubt that many were grown in the neighbourhood of Rome itself, but what the essayist calls the Colchester of those days was Pæstum, to which reference is made by Virgil in the Georgics thus rendered in Mr. Blackmore's elegant translation:

"The beds where twice the Pæstian Roses blow,  
The Endive's joy to drink the rannel's flow;"

from whence it would appear that the Pans and Cants of those days were willing to combine the growth of vegetables with Roses.

Now Pæstum is situated on the S.E. of Italy, some distance from Naples; the soil is rich and unctuous, and although now the place is given up to marshes and malaria, it must have been an ideal place for growing early flowers for their own market. It is, alas! many years since we were there, and

then the wonderful ruins of the Doric temples which are the present glory of the place had far more interest for us than Roses; but we do not recollect seeing anything but ordinary wild Roses, and whatever were the kinds cultivated then, we find no trace of them now. You had better hear what the essayist pleasantly says on these points. "Any place obtains an immortality by being named by Virgil," and the peculiarity of this mention of "the twice blowing Rose Gardena" of Pæstum, has attracted considerable notice and speculation. The true explanation seems to be that long and skillful culture had developed the Lucanian Roses beyond those of the growers of other places—they were the hybrid perpetuals of antiquity. Lucania was the Essex or Hertfordshire of Rome, and Pæstum was its Colchester or Cheshunt. The question of their transportation to Rome, so as to be fit for the most ordinary purpose of decoration, is one of some difficulty. Cut Roses come up to our great city in abundance every day, but then they come from places only a few miles distant, and by smooth-going express trains; a very different matter to the method of conveying them from Pæstum and other places to Rome. This question is, of course, closely mixed up with that of the varieties grown. Was there any similarity in form and texture between the Roses of those days and those of the present time? we have several writers who enter on the subject of Rose growing such as Pliny, Varro, and Columella, but as a rule they give us but little clue to the varieties grown. Pliny, indeed, has one passage to which the writer of the essay attaches a good deal of importance, and we think with reason, as it indicates the continuity of the Roses of the present day with those of the past, and the link which he considered it to be is our dear old friend the Cabbage Rose, for he describes one which had sixty petals, corresponding very much with the name given to that variety, *Rosa centifolia*. This Rose with some reason, the writer thinks, travelled westward with a good many other things, and found a home for itself in the sunny and poetic province, Provence, in the south of France, and from thence was introduced into England somewhere about the sixteenth century.

Mr. Jeans indignantly scots the interpretation that of late years has been given to this name, for it is said by some that it ought to be Provins and not Provence; Provins being a small town in the neighbourhood of Paris, long celebrated for its Roses. But I think we shall adhere to the more poetical name of Provence, especially as the writer states that the Provins Rose is a single, and not the very double flower that the Provence is. But admitting all that has been said about it, it forms a comparatively slight link between the modern and ancient Roses. It is essentially a summer Rose, and therefore can have no affinity with the twice-flowering Roses of Pæstum.

There are many other interesting points in the essay, which will be new to its readers. Few have ever thought that Roses in the time of the Roman Empire were cultivated in houses, but it is quite clear that the indignation expressed by some writers against those who were thus turning winter into summer, clearly proves that this was the case.

We forbear to make further extracts from this most valuable essay. It breaks up entirely fresh ground, and gives us glimpses into the past, which are most valuable; and we think that our readers will thank us for directing their attention to it. *H. H. D'O.*

## ORCHID NOTES AND GLEANINGS.

### ORCHIDS AT PARKFIELD, WORCESTER.

A FEW very good subjects are in flower here at the present time, viz., in the Cattleya-houses a fine piece of the true long pseudo-bulbed variety of Cattleya exoniensis ×, with four leads and twelve flowers, which is making a good show. This plant has been here for several years, having been purchased at the sale

of the famous collection of the late Mr. J. Day of Tottenham, and last season it made some capital pseudo-bulbs. Cattleya Trianae alba is represented by a plant with five or six leads; the flowers are pure white, with the exception of a yellow blotch in the throat. Cattleya Trianae ampliata has two of its large flowers expanded; the sepals and petals thrown back, as though unable to support their weight; the very pretty Saccolabium bellinum is in flower in the same house. Epidendrum radicans, and E. J. O'Brien are growing and flowering freely; and a plant of Vanda teres Anura has opened several spikes of flowers. In the Mexican-houses there is a good show of *Colognea cristata*, *C. cristata maxima*, and *C. Lemniana*; some hundreds of spikes altogether, and making a good show. Lycate Skinneri alba has a splendid flower nearly 8 inches in width, making the ordinary form look very small by the side of it. In the East Indian-houses there are several varieties of Phalenopsis in flower; the rare and evidently free-flowering Dendrobium atroviolaceum, with four spikes of its curious-coloured flowers; the sepals and petals greenish yellow, heavily spotted with purple, and lip of a beautiful shaded blue; Dendrobium eucam leucopterum, a cross between D. nobile × D. endocharis, has several of its large white and purple flowers open. *H.*

### DENDROBIUM SPECIOSUM.

This species is both well grown and well flowered at Stoke Park, near Slough, where Mr. Kemp prides so ably over the gardens and estate generally. The treatment of this somewhat shy-flowering Dendrobia is evidently well understood by him, as the plants I saw there a few weeks ago bear witness. Two plants, in tubs, each about 2 feet in diameter, were flowering grandly, one of strong growth carrying three, and many others two, of their arching racemes of fragrant flowers. One of the principal points in the culture appears to be the thorough ripening of the pseudo-bulbs. After flowering now, they will be grown on in an ordinary stove till growth is completed for the season—scm-time in June, after which a gradual hardening off will be carried out, and the plants stood for the remainder of the summer in a span-roofed frame, and allowed as much air and light as possible, no shading being required. At the approach of frost they are transferred to a cool greenhouse for a time, and from thence to the stove to develop their flower-spikes in January. *C. H., D.*

### DENDROBIUM WARDIANUM LOWN.

Several notes have appeared of late in the *Gardeners' Chronicle* concerning the above charming species of Orchid. It may be of interest to state that there are four pieces here very well flowered; one plant is in an 8-inch pot, and possesses nine flowering growths, and 130 flowers. The height of the plant is 2½ feet. Another plant here of a very fine type of this species has seventy very fine flowers, some of which measure 3½ inches in width; and one fine growth has thirty flowers in about a length of 15 inches, the top of the growth being thickly studded with groups of blooms in threes. *J. Snell, Grimston Gardens, Tadcaster.*

## BELGIUM.

### MEETING OF THE BRUSSELS ORCHIDÉENNE.

The last meeting was particularly noticeable for the Cypripedium staged. Besides those which had been shown at Ghent may be mentioned a magnificent hybrid from M. Madoux, which some consider to be *C. × Gertrude Hollington*, and others as *C. Lauro-bellatulum*—the name was not written on the label. Two fine hybrids obtained high awards, but the jury differed as to their true parentage. *C. × Sénateur Montefiore*, already described here, obtained a First-class Certificate, as did also *C. memoria Moensi*; both plants sent by M. Madoux. M. Moens showed *C. × Véruve* and *C. × Albertianum*, a very fine variety; M. Madoux exhibited an interesting *C. insigne*, the standard of which is almost entirely dark

brown of a most unusual tint. A group of *C. Lawrenceanum*, from MM. Lucien Linden et Cie., were much admired because of the exceptional breadth of the standards, and the bright colouring of the flowers. There were many other *Cypripediums* that, ten years ago, would have been much admired; now, there are so many new hybrids, that we are more critical.

M. Pauwels showed some fine plants of *Odontoglossum*

*Cattleya Trianaei*, a thick clump with five clusters of bloom, the latter well coloured, especially the lip, won distinction for Mr. H. Knight, of the Royal Gardens, Laeken.

M. Van Imshoot was successful with the Orchids which he had, a week before, shown at Ghent. A plant of *Dendrobium atrovioleaceum*, with the divisions of the flower cream coloured, dotted with large purple spots, and the lip almost wholly of a

Charlesworthi (very fine), from M. Cahuzac; and a fine *Odontoglossum Rickerianum*, from M. Barbier, *Ch. D. B.*

FLOWERS AT THE MARRIAGE OF PRINCESS HENRIETTE OF BELGIUM.

At the wedding of Princess Henriette celebrated in Brussels at the Count de Flanders' Palace on February 12, enormous quantities of flowers were used. They appeared in the form of sheafs, baskets, cushions, lyres, and sachets. The cushions, round and square, were of brocade or plush; the sachets were silk adorned with white flowers, the baskets of varied sizes and kinds; there was even a handsome vase, all arranged with consummate taste. The flowers most freely used were, naturally, Orchids; *Odontoglossum crispum album*, *Laelia anceps alba*, *Lycaste Skinneri alba*, *Cattleya Trianaei alba*, and others; Lilies of the Valley, Orange-blossoms, Carnations, Lilies, Lilac, and other flowers also were largely employed. Among the floral arrangements may be mentioned a basket in the form of a fleur-de-lys (in allusion to the Orleans family), which was offered by one of the regiments; a lyre from the Brussels Cercle artistique et littéraire, composed of Carnations and Orange-blossoms; a cushion decorated with duchesse lace and Lilies of the Valley, with *Laelia anceps alba* and *Cattleya Trianaei alba*, offered by the students of the Military Academy; a large silk sachet decked with Orchids and Orange-blossoms from Mme. Arthur Warocqué; and a silvered basket filled with Lilies and white Lilac from the Princess de Chimay. *Ch. D. B.*

THE WINTER GARDEN OF THE COUNT DE KERCHOVE.

VISITORS to Ghent will remember that one of the sights of the old Flemish city, the scene of the famous quinquennial horticultural exhibitions, is the winter garden belonging to the Count de Kerchove. It is about 164 feet in length by 68 in breadth, and 42 in height, and consists of a central nave with a span-roof, and an aisle which surrounds the whole building. Two galleries, one on each side, allow access to the visitors and workmen. The heating arrangements and necessary offices are in the basement.

The interior is laid out in the picturesque style which some of our architects are now decriing; but we think if they visited this conservatory they might be induced to alter their opinions. One great feature is a colossal pile of rockwork at one end of the building, overgrown with climbing Aroids, Ferns, and lightened with brightly-coloured foliage Begonias. This forms a grotto, from which emerges a meandering streamlet, bordered with undulating banks, covered with *Setaginella*, and dotted with noble Tree Ferns and Palms.

Here, the owner, the genial and eloquent Count de Kerchove, the President of the Royal Agricultural and Botanical Society of Ghent, derived inspiration for his valuable *Monograph of Palms*, a book in constant use, and one which makes us wish that a similar one on cultivated tree Ferns and Aroids may in time follow. It is nothing to the point to say that the Count is already one of the hardest workers in Belgium. Experience shows that it is just such men who find time for extra work of the kind mentioned. Our illustration (fig. 29) is from a photograph taken by the Count's head-gardener, looking out from beneath the grotto into the house. In former volumes we have given such full details relating to the plants in this house, that on the present occasion the mere mention is sufficient.

THE GREAT FROST OF 1895 AT KEW.

(Concluded from p. 197.)

SHRUBS, &c.—As a rule, even shrubs, generally regarded as perfectly hardy, which had been transplanted the previous autumn, were much cut up by the frost, whilst the same species which had not been

FIG. 29.—GROTTO IN THE CONSERVATORY OF COUNT KERCHOVE DE DENTERGHEM, LOOKING FROM WITHIN OUTWARDS.

*glossum Rossi majus*, one of which attracted considerable attention, and won a First-class Diploma of Honour, *par acclamation*. The two petals are almost wholly pale chocolate-brown, with, towards the edge of the zone, spots of dark carmine-red, the whole bordered with a pure white band; the three sepals are all spotted with the same colour as are the petals; the white lip is of medium size. *Phalænopsis Schilleriana*, sent by the same Orchid-grower, was noticeable for its dark colour. *Cattleya chocoensis alba*, a beautiful plant with six charming flowers, and leaves gracefully bent back; and

dark violet tint. He had also a series of natural hybrid *Odontoglossums*, of the genus *Wilckeanum*, won an award for MM. Linden. One of the latter plants bore a very large flower, well spotted, the petals white and yellow; another had a yellowish-white ground; a third was chiefly of a dull yellow-tint. M. Cahuzac obtained a First-class Certificate of Merit for an *Odontoglossum*—a natural hybrid of the Andersoni group, but of a very peculiar dark canary-yellow colour, delicately speckled with carmine. I must note also *Cattleya Trianaei alba*, from M. de Lombaerde; *Cypripedium*

removed were much less affected. Young plants of many species were killed, whereas older ones of the same species were only badly injured. Examples are *Azalea rhombica*, *Daphniphyllum*, variegated *Eragrostis*, and *Rhamnus alaternus variegata*. In a few cases, exactly the reverse has happened; as, for instance, *Berberis Darwini* and *Baccharis halimifolia*, old plants of which were killed back to hard wood and did not break again, whereas smaller ones broke freely. Double *Gorse* and *Ulex nanus* were both killed to the ground; even in rather sheltered spots the common *Gorse* suffered as much at Kew as it did on the commons in the neighbourhood of London. The Irish upright *Gorse* was quite killed. Amongst other Leguminosæ which may be mentioned are *Catalpinia japonica*, young plants of which were killed, whilst older ones were uninjured. Of the yellow Spanish Broom, fully 90 per cent. were quite killed; young plants of *Halimodendron argenteum* died, but older ones were unaffected. The South European *Coronilla juncea* was killed even against a wall.

Peat-loving plants afford some curious results. The common *Liog*, *Calluna vulgaris*, and some of its varieties, suffered so much that they have had to be destroyed. The only *Erica* which were killed outright are *E. mediterranea*, *E. codonoder*, and some of the varieties of *E. cinerea*. Old plants of the Cornish Heath, *E. vagans*, and of *E. cinerea* were crippled beyond recovery. *E. stricta* was damaged, but has since quite recovered. A large quantity of *Azalea indica*, raised from seed collected by Professor C. S. Sargent in Japan, stood out in the nursery, some protected, others not at all; and not one has been killed. The old single white hairy-leaved *Azalea indica* shows now no traces of the trial through which it has passed; and *A. amena* has shaken off the effects of the frost. Judging from the behaviour of the two last-mentioned plants at Kew, the former seems the hardier. *Dabeocia polifolia*: of all the stock at Kew only two plants were quite uninjured; the old plants were killed to the ground, and a few young ones killed outright—but on the whole, young plants have stood better than the old ones.

New Zealand shrubs have suffered much. In fact, *Plagianthus Lyalli* is perhaps the only one which has entirely escaped. *P. betulinus*, in the open, was quite killed, and *P. pulchellus*, against a wall, was killed to the ground. Most of the shrubby *Veronicas* were badly hurt. *Rubus australis* was killed against a wall. Large beds of *Olearia Haastii* were cut down to the ground, but are now breaking freely; young stuff was completely killed. *O. Traversi* and *O. macrodonta* were killed in the open; the latter even against a wall.

*Choisya ternata* in the open has stood well, as also against a wall; this is perhaps the only Mexican flowering shrub which can fairly be called hardy in the neighbourhood of London. Of *Ceanothus*, *C. cuneatus* is the only one at Kew which is absolutely untouched. The following species were completely killed, even against a wall: *C. papillosus*, *C. rigidus*, *C. Veitchianus*, and *C. dentatus*. The garden hybrids, such as *Gloire de Versailles*, &c., had their points killed in the open, but they broke freely, and have flowered abundantly. Some of the younger stock were also slightly cut back, although they were protected by dry leaves and Spruce branches. A covering of dry leaves kept from being blown away by Spruce or Cedar branches is the most effective winter protection for young or tender shrubs.

The only hardy *Escallonia* is *E. philippiana*, which we never attempt to shelter at all. All the other species, in spite of protection, were badly injured; some few were killed outright, others have since freely broken from the ground level. Other South-American plants which have suffered are the *Azaras*; the only one which has escaped in the open (where it was cut to the ground) is *A. microphylla*.

Of all the species of *Cistus* only one can be depended upon near London, viz., *C. laurifolius*, which passed through the winter unscathed, all the others being killed in the open. The shrubby

*Helianthemums*, such as *H. alyesoides*, *H. formosum*, &c., have mostly managed to survive.

*Corylopsis himalayana* is alive against a wall, but has perished in the open; the other species of *Corylopsis* have not been injured in any way. One Chinese member of the Witch Hazel family has succumbed in the open, *Loropetalum chinensis*; this makes a pretty cool-house bush, but it is useless trying to cultivate it in the outside garden. Of Californian shrubs all the young plants of the following have been killed in the open: *Carpentaria californica*, *Fremontia californica*, and *Garrya elliptica*.

Of the Holly family there is not much to be stated. None of the forms of *Ilex aquifolium* seem to have suffered, but the Chinese *I. cornuta* was badly cut (it is now, however, rapidly recovering); the Himalayan *I. dipyrrena* was injured in a less degree, and the South United States *I. Dahoon* was quite killed. *I. crenata*, like so many Japanese plants, has again proved its hardiness.

In previous severe frosts at Kew, *Laurustinus*, *Arbutus*, and the Bay (*Laurus nobilis*) have been killed wholesale. This year they escaped, notwithstanding exposure probably to a greater degree of cold, comparatively uninjured; nor did the evergreen Oaks, of which Kew possesses many exceptionally fine specimens, suffer any appreciable permanent injury.

#### BAMBOOS.

In the *Gardeners' Chronicle* (June 22, 1895, p. 762), Mr. Bean, the foreman of the Arboretum, has given an account of the behaviour of the outdoor collection of Bamboos during the winter. The following extract summarises the facts: "On New Year's Day the Bamboo garden at Kew looked practically in the same state as it had done in the previous August . . . of three dozen or so kinds, . . . not one has been killed outright. About half-a-dozen have scarcely been affected at all; perhaps twice as many more have suffered only a very temporary check. Of the remainder, some have been killed to the ground, whilst the others have had the old stems so severely injured that it is unlikely these particular stems will ever regain their former luxuriant leafage, although new leaves are pushing; most of them, however, are sending up strong new growths from the base, and with all, except one or two, the visible effects of the frost will have disappeared in a few months."

Our experience shows that in gardens with climatic conditions similar to those of Kew, the following species may be expected to pass through even the severest winters with no more injury than a very temporary disfigurement of the foliage, and in some instances not even that. These are, consequently, the kinds which should be selected for planting in districts new to the cultivation of Bamboos, and where it would be desirable to ascertain the suitability of the climate before planting extensively:—

- Arundinaria nitida*, Mitford (*A. khasiana*, Hort).
- Phyllostachys Henonis*.
- " *nigra*.
- " var. *Boryana*.
- " var. *punctata*.
- " *viridi-glaucescens*.
- " *flexuosa*.
- Bambusa palmata*.
- " *pygmaea*.
- Arundinaria japonica*.
- " *Veitchii*.

*Kew Bulletin, January.*

## ITALY.

### THE ROYAL BOTANIC GARDEN, PORTICI.

COLEUS.—This year, visitors have much admired, at the Portici Botanic Garden, the varieties of *Coleus*, which may perhaps be considered to form the most complete collection ever made of these beautiful Labiate, and certainly as the *non plus ultra* for size of the foliage and habit of the plants. This condition is due to the cultivation of the head gardener, Mr. P. Deluca, who justly merits the praise of all visitors.

There may be seen in this garden *Coleus* of the most varied dimensions; in fact, plants of all sizes, from the dwarf forms which measure a foot in height, and therefore look as if they were stemless, to the gigantic varieties measuring 6 feet in height, with a circumference of 9 feet at the top and 5 inches at the bottom of the stem. Good judges would certainly be astonished at some of the largest leaves, at their varied colours, and also at their dimensions, which, in some plants, reaches to 18 inches in length and 13 inches in breadth.

I think that *Coleus macrophyllus* of the above dimensions has only been obtained at Portici; this fine variety was, by one of the chief horticultural firms in Italy, named *Regalia*. Recently many different names have been given to it, and the confusion thus created caused amateur growers of such plants to buy the same variety again and again under different names.

The seeds were sown in small pots at the end of February, and were sheltered from cold in hot-houses; by the end of April, when the plants were still small, they were transferred to other pots filled with good garden soil. All the time the plants were in the hot-house they were frequently watered and manured.

Of the numerous varieties thus obtained, two small specimens are kept in the hot-house as original types, while the others are already transplanted into small pots. The plants thus kept in the hot-houses retain their leaves more or less throughout the winter according to the degree of heat and dryness therein maintained.

In order to make the plants attain their full development, sowing must be done in April, not only with the diligence and care which they received at Portici, but a liquid-manure should be used, varying in strength according to the age and development of the plants.

*Musa*.—At the entrance of the garden two magnificent specimens of *Musa Ensete* may be seen growing in the open ground. These plants are hardly four years old, and they have already attained the size of 6 feet in circumference at the base of the trunk, and about 4½ feet in height. The leaves measure about 9 feet in length, and about 28 inches in breadth.

These plants are protected from cold in winter by means of dry leaves; in summer they are manured, and the whole of each plant is daily watered, care being taken that the water remains in the base of the leaves, in order to maintain a constantly wet atmosphere. *Dr. Giovanni Mottareale.*

## NATURAL HYBRID ORCHIDS.

(Continued from p. 199.)

In 1868 *Miltonia × festiva* was described from materials sent by Mr. Stuart Low (*Gard. Chron.*, 1863, p. 572), when Reichenbach remarked:—"It is an old friend of ours, having been sent to us as early as 1865, by Mr. Lüdeman, of Paris. Yet we were not disposed to write on a single (two-flowered) withered peduncle, and it was put aside among our numerous doubtful Orchids, and labelled as '*Mil-tonia*, a hybrid.' If mere conjectures may be permitted, when proffered merely as such, we should venture to ask whether it is not a male between *Mil-tonia spectabilis* and *flavescens*?" The author then went on to point out its intermediate character. Immediately afterwards Mr. J. Anderson wrote that the same plant had appeared in the Meadowbank collection, having been purchased at Stevens' rooms in December, 1866, labelled *Mil-tonia spectabilis*, and observed, "I had made up my mind previous to reading the Professor's remarks, that the plant was a male, bearing some of the characteristics of *Cyrtoclitum flavescens*, and of *Mil-tonia spectabilis*, and I am glad to see the same view taken by one of our highest authorities. . . . It is a singular hybrid, altogether one from Nature's mint, brought about by insect agency" (*l.c.*, p. 600). Then follow some interesting remarks about the curious way in which the characters of the two parents are combined in the hybrid.

In 1868, also, *Odontoglossum × Andersonianum*,

FIGS. 30, 31.—VIEWS IN THE WINTER GARDEN, BELONGING TO COUNT REECHOWE DE DENTBERGHEM. (SEE P. 231.)

the first natural hybrid in the genus, was described (*Gard. Chron.*, 1868, p. 599), though its origin was not at first suspected. It appeared in the previous year in a batch of *O. crispum* sent by Blunt to Messrs. Hugh Low & Co., of Clapton, whence it passed into the collection of the late James Dawson, Esq., of Meadowbank, near Glasgow, being named after that gentleman's gardener, whose remarks about *Miltonia* × *festiva* we have just considered. Reichenbach, though describing it as a new species, remarked that it was one of those doubtful *Odontoglossum* so troublesome to the orchidist, and remarked that, at first sight, it recalled both *O. crispum* and *O. præstans*. Afterwards it appeared in the collections of J. Day, Esq., at Tottenham, and of Sam Mendel, Esq., at Manchester, when Reichenbach again wrote about it as probably a hybrid between *O. crispum* and *O. præstans* or *gloriosum* (*Gard. Chron.*, 1872, p. 41), adding that Mr. Harry Veitch at once had the idea of its being a hybrid between the two former, which is certainly correct. *O. præstans*, being a native of Peru, is obviously out of the question. It is interesting to note that it was Mr. Veitch who so shrewdly guessed the origin of this plant, for it shows that the results of the experiments in artificial hybridisation among Orchids initiated by Dominy in the Veitchian establishment in the early fifties were not thrown away; indeed, it is impossible to say how much of our present knowledge of natural hybrids is due to these experiments.

In October, 1868, a second hybrid *Odontoglossum* appeared, with Messrs. Hugh Low & Co. of Clapton, which was described immediately afterwards as *O. × mulus* (*Reh. f. Xen. Orch.*, II., p. 151, t. 160, figs. 1, 2). Its author pointed out that it was intermediate between *O. gloriosum* and *O. luteopurpureum*, in size, shape, and colour, and notably in the column wings and crests of the lip, while in the vegetative organs it most resembled the latter. The name proposed shows what Reichenbach thought of its origin. In 1872 three more additions to the ranks of natural hybrid Orchids were recorded, namely *Odontoglossum* × *Denisonia*, *O. × Coradinei*, and *Phalænopsis* × *Veitchiana*, and we may here anticipate matters a little by remarking that the former has since been produced artificially by crossing together the two supposed parents.

*Odontoglossum* × *Denisonia* flowered in the collection of Lord Lonsborough, and received a First-class Certificate from the Royal Horticultural Society, on January 17, 1872. It was named *O. × Denisonia* in compliment to Lady Lonsborough, and was at first thought to be a white variety of *O. luteopurpureum*; but Mr. Denning, the gardener, afterwards stated that it flowered in an importation of *O. crispum*, made by Messrs. Backhouse & Son, of York, three years before, and was secured by Lord Lonsborough (*Fl. Mag.*, 1872, t. 26). Mr. Denning considered it to be a natural hybrid between *O. luteopurpureum* or *O. hystrix* (a variety of the same) and *O. crispum*, on account of its intermediate character. In 1880 a plant flowered in the collection of M. Massange de Louvrex, of Baillonville, Belgium, which was acquired by Messrs. Hugh Low & Co., in 1878, among plants of *O. crispum*. Reichenbach, perhaps overlooking the earlier name, described it under the name of *O. × Wilckeanum*, as a natural hybrid between *O. luteopurpureum* and *O. crispum* (*Gard. Chron.*, 1880, i., p. 298). These two species were afterwards artificially crossed by M. Leroy, gardener to Baron Edmond de Rothschild, Armainvilliers, near Paris, and a seedling flowered in May, 1890, when five and a half years old, which was at first described under the name of *O. × Leroyanum* (Castle, in *Gard. Chron.*, 1890, i., p. 704), but this has since been referred to as a form of the present hybrid.

*Odontoglossum* × *Coradinei* appeared in 1872, when a plant flowered in the establishment of Messrs. James Veitch & Sons, in an importation of *O. crispum*. It was named by Reichenbach after one of the collectors who sent it home (*Gard. Chron.*, 1872, p. 1068, fig. 251), the author remarking that it was probably a hybrid between *O. triamphans* and some

species of the *O. odoratum* group. It is now known, however, that *O. crispum* and *O. Lindleyanum* are the parents. I may here remark, that the history of this and other hybrid *Odontoglossums* has been treated in full in a series of articles in the *Orchid Review*.

*Phalaenopsis* × *Veitchiana* was the second natural hybrid in the genus. In describing it, Reichenbach remarked:—"It is a highly curious fact that there has appeared among the numerous *Phalaenopsis* in the possession of Messrs. Veitch, one that is highly probable is a natural hybrid between *P. equestris* (rosea) and *Schilleriana*," and he then went on to show how it combined the characters of the two species (*Gard. Chron.*, 1872, p. 935). One or two other plants have since appeared, and it is quite certain that they are natural hybrids between *P. Schilleriana* and *P. rosea*.

In 1875, a third hybrid *Phalaenopsis* appeared, among importations of *P. Aphrodite* and *P. Schilleriana*, received in the previous year by Messrs. Hugh Lox & Co., and this received the name of *P. × leucorrhoda* (Rehb., f., in *Gard. Chron.*, 1875, i., p. 301). It well combines the characters of the two parent species. Shortly afterwards, a second hybrid flowered out of the same importation, and was described by Reichenbach under the name of *P. × casta* (*Gard. Chron.*, 1875, i., p. 590). It is, however, only a variety of *P. × leucorrhoda*.

The facts representing these Philippine *Phalaenopsis* are graphically expressed in the following diagram, where the figures 1, 2, 3 represent the species, and the intervening crosses in the sides of the triangle, the hybrids:

It is interesting to note that every possible combination between these three species is now known, and that the origin of one of the hybrids (*P. × intermedia*) has been demonstrated artificially. It is quite certain that the insects which fertilise the flowers do not confine their visits to any one particular species. *R. A. Rolfe*.

(To be continued.)

## THE WEEK'S WORK.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Kollston Hall, Burton-on-Trent.

**PEACHES AND NECTARINES.**—Owing to the exceptional mildness of the season, the buds upon these trees are swelling fast, and pruning should, therefore, be done at once, and the training of the trees completed. Cut out all the old, bare wood, and thin the young growths to about 4 inches apart, sacrificing the most weakly shoots. Any that requires shortening must be cut to a wood-bud. These are easily distinguished, being more pointed than the bloom-buds. When the pruning is finished, give the trees and walls a good syringing with the following solution, soapy water 4 gallons, petroleum  $\frac{1}{2}$  pint, and sulphur  $\frac{1}{2}$  lb., which should be applied at a temperature of 120°, keeping the liquid well stirred during use. Clear away the old mulching from the borders, and sprinkle them with lime. If the trees require stimulating, apply a dressing of one of the many fruit-tree manures obtainable, lightly pointing same in, before adding a thin layer of half-decayed manure.

**GRAPE VINES** which are trained against walls out of doors should now be pruned by removing all old fruiting canes that have long spurs, and laying in their places young well-ripened canes. The laterals should be spurred back to a prominent eye. Mildew is generally the worst pest that attacks out-door vines, therefore, before fastening the rods, clean off any loose bark from the vines, and paint them with a mixture of water 1 gallon, soft-soap 6 oz., and sulphur 4 oz. Syringe the wall afterwards with the same mixture, and it will assist to keep red-spider in check during the summer.

**NUTS.**—The small, inconspicuous red-coloured female flowers are now beginning to show them-

selves. If any of the bushes are deficient in male catkins, some branches should be cut from those that have an abundance, and tied on to the top of the stems of the bushes that require them, keeping them well above the branches. When the weather is fine and dry, the stems should be tapped at least once during the middle part of the day. This will liberate the pollen, causing it to fall gently on to the branches. The present is a suitable time to effect what pruning is necessary. If the bushes are fully grown, all the gross wood should be cut clean out, and the laterals pruned back to a bloom-bud; the old fruiting-wood being cut back to within half an inch of their base, whence fresh laterals will grow which will fruit the next year. Young bushes require to have their leading shoots shortened to about one-third of their length, and the other branches treated similarly to those of older bushes.

### THE FLOWER GARDEN

By HEOLEY WARREN, Gardener, Aston Clinton, Tring.

**PRUNING THE ROSES.**—Owing to the mildness, some gardeners may be tempted to prune their roses, with the effect that the buds which are left will start into growth, probably to get cut by late frosts; but by allowing the young growths now appearing to remain for a time, injury in this way will be generally averted. In the southern counties the second week in March is early enough to prune roses which are planted in exposed beds, and in the midland and northern ones the end of the month is soon enough. Climbing roses on walls and in sheltered positions may, on the contrary, be pruned without further delay; retain as many of the best shoots of last year as possible, but removing all the weak, flowerless, and unripened ones, the idea being to keep the plants as vigorous as possible by encouraging the growth of the best shoots, which, if they are well ripened, will not fail to bloom well.

**PROPAGATION OF BEDDING PLANTS.**—The gardener must take heed that the various batches of plants are grown on without receiving any check; tender seedlings will need especial attention in watering, and in some cases it will be safer to plunge the seed-pots or pans up to their rims in a vessel filled with tepid water than to apply water overhead. This applies especially to seedling *Begonias*, *Gloxinias*, *Lobelias*, and others of small size. A gentle hot-bed frame is a useful appliance where many bedding plants have to be raised, for the latter being then near the glass, do not get drawn. It is, indeed, best to have several such frames, so as to be enabled to suit the various kinds of plants, and it is always prudent to keep up good warm linings to these frames, so as to make it an easy matter to give air without lowering the top-heat.

**MIMULUSES.**—The spotted varieties are amongst some of the most beautiful of bedding plants, and in many southern and western counties they are treated as hardy plants. If grown from seed, a great variety of colours may be obtained from a packet of seeds purchased of a trustworthy seedman. A sowing may now be made, and the seed-pans placed in a frame or pit having a temperature of 50° to 55°, adopting the same kind of after-treatment as that advised for similar plants in a former Calendar. Stock roots of *Marrieton's* or the common Musk may be placed in heat, for the production of cuttings.

**DAHLIAS.**—All beds or borders which it is intended to plant with Dahlias should be heavily manured and trenched, say extra outlay made in this matter being well repaid by the fineness of the blooms and long continued vigour of the plants.

**HERBACEOUS PLANTS.**—These are, in many parts, already making rapid growth, and any which were brought in last autumn, and have been standing in cold frames, may now be planted out, not omitting to label each one correctly when planted. All seasonable work in connection with herbaceous plants, and borders that may have been overlooked, should now be completed as rapidly as possible, and everything made neat and tidy.

**NICOTIANA AFFINIS.**—This fragrant white-flowered plant is useful in borders and beds, and if seeds are sown in heat at this date, and the plants, when large enough to handle, pricked off singly into small pots or boxes, they will make good strong plants by the end of May, which is quite soon enough to plant them in the open. *Nicotiana affinis*

makes a good dot plant in beds of other kinds of plants, and looks well in groups of half-a-dozen or more. A few plants distributed about the shrubberies in suitable places never fail to attract attention.

### THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorset.

**LÆLIOPSIS DOMINGENSIS.**—This rare Orchid, now in bloom, has flowers which are produced in a similar manner to those of *Lælia acuminata*, and they measure about 2 inches across, the colours being pale rose-mauve, with purple veins and markings. It should be found in all collections. Basket culture appears to suit its requirements, if it be planted in a very thin layer of coarse peat and sphagnum-moss. In order to obtain strong-flowering growths, the plant should be hung up on the south side of the East Indian or Mexican-house, being thinly shaded in the middle hours of the day when the sun is bright, but it is benefited by exposure to direct sunlight in the morning and afternoon. Whilst the plant is growing, water should be liberally afforded, and water will be needed almost every day, owing to its high and dry position. When the new pseudo-bulbs are full-grown, water should be sparingly applied—only as much as will keep them plump.

**ANÆCTOCHILUS.**—Judging from the rarity of this genus in most collections of Orchids, it is doubtless considered by growers to be almost worthless. Certainly, the insignificant size of the flowers renders them of no value; still, *Anæctochilus* deserves more extended cultivation, chiefly because of the marvellous beauty of their leaves. In many instances it has been found very difficult to keep the plants in good condition for any considerable length of time. My own failures have taught me that they will grow and increase satisfactorily for a few seasons, after which, without there being any alteration in treatment, their leaves have become spotted, and the succulent stems decayed. This would show that the treatment was wrong, and that light and air whilst growth is being made were insufficient for the needs of the plants, and rest at the proper time inadequate. Orchid-growers who admire *Anæctochilus*, and possess the proper conveniences for growing them, but who have been deterred from attempting their culture under the belief that there was no chance of success with them, should at least make an attempt to cultivate them. They should, if possible, get imported rhizomes to commence with, or established plants from some nurseryman in whom reliance may be placed that the plants have been fairly treated, and not grown in a stifling, over-warm atmosphere. *Anæctochilus pstola* being the least difficult to manage, might be the first variety taken with which to make a beginning, and if success eventually followed, other beautiful varieties could be added to the collection, such as *A. Dawsonianus*, *A. Lowii*, *A. Roxburghi*, *A. striatus*, *A. setaceus*, &c. These plants make good roots in a mixture of sphagnum-moss, chopped up finely, a liberal quantity of coarse silver-sand, and some small, clean crocks. As regards pots, use those of 2 or 3 inches in diameter, planting two or more pieces of the rhizomes in each, afterwards plunging the pots as closely together as possible in a pan filled with fresh sphagnum-moss. When first potted, they should be stood in a shady part of the East India-house, and a bell-glass with a hole at the apex placed over them. This hole should be stopped with a cork, so that till the plants begin to grow they may, during the greater part of the time, be kept close. The compost used should be kept in a moist but not wet state, and the interior of the bell-glass wiped dry occasionally. When the roots are seen, and the young leaves commence to unfold themselves, the bell-glass may be tilted a little, and the cork removed during the daytime, so as to afford air, but at night the glass should be closed. The kind of shade afforded must not be of too heavy nor too slight a kind whilst the sun is on the plants, and the better practice is to shade one side of the glass only. After the plants cease to grow the dower-spikes push up, and being of little value in a decorative sense, they may be pinched off, and the plants stood in a warm corner of the Cattleya-house, there to be rested. Whilst here, the plants must never be allowed to get quite dry, but the compost should be kept always slightly moist. If the plants make good growth, the space within the bell-glass will soon be filled, and the leading growths, as soon as young roots appear, may be divided and repotted in the manner described for imported pieces, and the right season for doing this is during the present month or in August.

## PLANTS AND THEIR CULTURE.

B. J. McINTYRE, *Gardener, Woodside, Darlington.*

**CODIÆUMS.**—These plants, as *Crotone*s should now be called, succeed in the best manner if they have a house to themselves, requiring, as they do, a special kind of treatment to bring out their colours to the greatest degree of perfection. Where there exists but one stove, I would recommend that these plants be kept altogether at one end of that house. Propagation of *Codiæums* is effected by seeds and cuttings, the former method being resorted to when the object is to obtain new varieties. Autumn striking is preferable, but equally successful results are obtained from spring striking; the one great advantage of autumn propagation being that the plants, provided they have been well cared for during the winter, make nice stuff early in the month of February, and are at that time in a fit state to re-pot, especially if required of small size for dinner-table decoration or grouping. Doing this, gives perfect plants at an early part of the season; and it is a method I have followed for many years. Plants struck in autumn and grown on, if made much use of, begin to lose their bottom leaves and become unsightly. In September I "ring" them well up the stems, cutting the bark right round, apply some sphagnum-moss to the part, tying it on with matting, and keep this moist till roots appear; then cut off the part above the ringed spot and pot-up in flower-pots of 3 or 4 inches diameter, according to size of tops, and plunge in a bottom-heat of 75° or 80° until they are well established. In this manner nice plants can be obtained in a very short space of time, and without running any risk of losing the foliage. The plants from which the tops have been cut, provided they are kept rather dry at the root, will break freely and afford cuttings that may be used in the spring. The present time, and, indeed, any part of February is a good time, to strike cuttings to furnish plants for use in the autumn. A good sort of house for growing *Codiæums* is one with a span-roof, and whose length runs north and south. It should be roofed with large panes of glass, so as to be as light as possible, sunshine being of the greatest importance. Except in the very hottest weather, no kind of shading should be used. In the season of growth, ventilation on all favourable occasions should be freely afforded, so long as a temperature of 75° or 80° is maintained, closing the house early in the afternoon, and at all times maintaining a moist atmosphere. When these conditions are afforded, thrips and red spider seldom infest the plants, but mealy-bug will do so; and brown-scale attacks plants which are grown in houses having too little warmth. If red-spider be noticed on the plants, the regular use of the syringe and water at the same temperature as the house will clear them off, unless very numerous, when it may be advisable to use flowers-of-sulphur, thoroughly mixed with the water. Thrips succumb to fumigation with tobacco-paper, on which cayenne pepper is sprinkled; and when the plants are not too large dipping in Fowler's Insecticide may be resorted to. For the destruction of mealy-bug, Fir-tree oil may be used, applying it with the syringe, or the plants may be dipped into it at a temperature of 90°. The soil for potting *Codiæums* may consist of two parts rich loam to one part good peat, with sufficient silver-sand added to make it of the desired porosity. Having been successful myself in the cultivation of these plants, I recommend this mixture as being that which I have found the best. In the case of specimen-plants, the materials should not be used in a finely broken-up condition, and charcoal in good-sized pieces may be added to the compost, as it is very beneficial in the case of these large plants. The present is a good time to shift those specimen-plants which require it, and top-dress any others. It should be remembered that much pot-room leads to redundant growth, and a consequent loss of colour in the foliage; the cultivator should, therefore, aim at well-coloured foliage and moderate-sized plants, rather than the reverse. When plants are freely growing, some kind of artificial manure may be often afforded, and if it be not used of too great strength, it is always advantageous. If evaporating pans are fixed on the hot-water pipe, they should be kept filled with liquid-manure.

## FRUITS UNDER GLASS.

B. J. POPE, *Gardener, Highclere Castle, Newbury.*

**POTTING PINE-APPLES, AND THE SOIL FOR THE SAME.**—The compost for the first potting of the year should now be prepared, and afterwards placed under cover ready for use. The loam should be, if possible, from some rich pasture, full of fibre,

not much decayed—that is, it should not have been in stack for longer than one year. This should be pulled in pieces, the finer portions being removed, and only the lumpy, fibry portions made use of. To every wheel-barrow-load of loam an 8-inch potful of bone-meal may be added, and if the loam is stiff and adhesive a small quantity of charcoal in a fine state, or coarse sand, may be mixed with it. Suckers should come into 6 and 7-inch pots, according to their size and strength, the soil being pressed very firmly, and afterwards plunged them in a bottom-heat of 90°, and afford no water to the soil for ten days or a little longer period, by which time roots will have begun to be made. The early autumn-potted suckers, whose pots are well filled with roots, may now be shifted into their fruiting-pots, i.e., 11 or 12 inches. These pots should be clean and well-drained, and have a layer of the roughest of the compost placed over the crocks, the plants being placed low down in the pots; the fresh soil, previously made warm, must not be too moist, and should be made firm around the old ball, ample space for water being left. Unhealthy plants should have the soil shaken carefully from the roots, and be re-potted. In very bright weather some light shading may be given for an hour or two during the hottest part of the day, and a slight dewing with the syringe every other day till the roots begin to work in the new soil. After this has taken place, the water-pot should take the place of the syringe for a time. Any stools of varieties that throw suckers sparingly, such as the Smooth Cayenne, should be retained after the fruit is removed, stripped of their leaves, and laid in some warmed soil, leaf-mould, &c., with a bottom-heat of 85°, when suckers will usually be produced in sufficient abundance, which can be taken off and potted from time to time as they become large enough.

**EARLY VINES.**—Continue to give close attention to stopping, tying, and thinning, as the Vines grow, removing bunches when too numerous as early as possible, allowing as much extension of foliage as is consistent with the space command, and beyond this point stopping the shoots closely. Some fresh short stable-manure may be used as a mulch, and guano placed in the evaporating troughs, if there are any attached to the hot-water pipe. Ventilate carefully, and close early in the afternoon with plenty of moisture about. Muscat Vines approaching the flowering stage should have a night temperature of 65° to 70°, with a rise of 10° or 15° in the daytime, closing theinery at 85° in bright weather. As fast as the flowers open, each bunch should be fertilised with pollen of the Black Hamburgh. Attend to the dis-budding of the Vines in succession vineries, and tie down the shoots carefully before they touch the roof. The syringing of all Vines should cease when the bunches can be seen at the tips of the shoots, and a moist air obtained by damping the paths, &c. If the borders need water at this stage, afford a good supply at once.

## THE KITCHEN GARDEN.

B. J. HERRIN, *Gardener, Droghda, Maidenhead.*

**THE BORDER OF FLOURISHING HERBS.**—A good supply of pot herbs being a matter of some importance in most country gardens, it is necessary at this season to make a thorough examination of the plants, and if the stock of some plants is below what it should be, to take means to supply what is deficient. Those herbs which are increased by division, may be taken up and divided. Of these Tarragon is one of the more important, the young shoots being in demand in most kitchens the whole year. A portion of the stock of roots should be lifted, divided, and planted in another part of the border, reserving the portion left undivided for forcing next winter. Re-plant the small divisions made with two or three shoots each in lines at 1 foot apart each way, treading the soil firmly about the roots. As Tarragon is starting into growth early this season, the replanting should be carried out forthwith. Common Sorrel is treated in the same manner. The French or broad-leaved Sorrel, *Rumex acetatus*, is sometimes used in this country as a substitute for Spinach, but it is intensely acid, and its only recommendation is, that it stands dry weather well. The Sorrels may be raised from seed sown in March. Seeds may also be sown sometime late in that month of Chervil, common Thyme, Fennel, Borage, Winter Savory, Pot Marjoram, Basil, Lavender, Sage, and Rosemary. The last three may be also increased by cuttings or slips taken off with a heel of old wool and inserted firmly in the border, which soon make strong plants. Sweet

Basil and Sweet Marjoram are best sown in boxes of light soil placed in a hot-bed frame or warm house, and the plants afterwards pricked-off into the border late in May or early in June. All the beds of herbs should be weeded and cleaned, the plants, if loose, made firm in the soil by tramping around them, and the soil afterwards stirred with the hoe or hand-fork slightly, and top-dressed with some fresh soil. The roots of Spear Mint may be lifted and placed in boxes of light soil, and put into a forcing house for furnishing green shoots. The easiest method of increasing this useful herb is to dibble cuttings into the open border in April, which soon root if shoots of 3 or 4 inches in length be employed. These young plants, if the land be good, soon make plants capable of furnishing a good supply of tops late in the summer.

**PARSLEY.**—A sowing should be made on a warm border or open sunny position in the quarters; and it should be sown in sufficient quantity to afford a full supply after the plants now in use have run to seed. Owing to the weather, Parsley has needed no protection, but it will be prudent to reserve that which was planted in a sheltered position or in frames for late use, as we may yet get hard weather.

**ONIONS.**—Although it is somewhat early to sow the main crop of Onions in northern or cold localities, in the southern and midland counties seed may be sown whenever the state of the soil admits of its being trodden on without being spoiled. It sometimes happens that a week or two of fine dry weather is experienced in February, followed by stormy weather in March, and if the first chance be not taken, a long time may elapse before another favourable opportunity occurs for sowing Onion seed. Up to the present time, but little rain has fallen this month, and fine weather seems likely to continue, therefore if the soil is in a thoroughly workable order, the seeds may be sown forthwith. At the time of writing, the moderately light soil here is in first-rate order. If the Onion-ground has been manured and trenched as advised some time since, and left in a rough state, a heavy dressing of wood-ashes and soot in about equal proportions should be spread over the plot, and worked into the surface with a wooden rake, breaking down all the clods, and roughly levelling it. The land is then in a fit condition for being trodden all over, after which large stones, &c., should be raked off it, and the surface made smooth and level in readiness for the drills being drawn, which should be about 3-inch deep and 1 foot apart. The seeds, if new and well harvested, should be sown thinly and evenly in the drills, and covered-in with the feet. The ground should afterwards be trodden all over both in a line with, and across the drills; and finally raked in the direction of the drills, leaving a fine and even surface. Where the soil is heavy, it is advisable to postpone the sowing till it is dry enough to be broken down finely, and in other ways prepared. If Onions must follow Celery, the ground should be deeply dug with the fork, and manure added if it be required, and then left till the surface dries before it is sown. Onion plants raised in boxes should be gradually exposed to the light as soon as germination has taken place, and kept for a week or two near the glass, in a temperature of 45° to 50°, and then slowly hardened off, finally coming into the cold frame some weeks before they are planted out.

**GENERAL REMARKS.**—The site of the current year's stock of Saakals for forcing next winter should now be determined, which should be open, and well exposed to the sun, and if not already prepared, it should now be heavily manured and deeply dug, the manure coming between the first and second spits, if it is trenched or bastard-trenched. Let it lie rough till planting-time. The positions of the principal kitchen garden crops of the year should now be decided upon. All tallgrowing varieties of Peas are advantageously sown in rows at distances of about 11 feet apart, which will allow of four or five rows of Potatoes or Cauliflowers, or a greater number of rows of Parsnips, Beet, and Carrots, being sown between them.

**BRITISH BATTLES ON LAND AND SEA.**—By JAMES GRANT, (Cassell & Co., London, Paris, and Melbourne).—This publication is a wonderful example of the amount of information which can nowadays be obtained for a penny a week. Each issue contains over thirty pages, various illustrations and maps, and is calculated to stir the youthful mind to patriotic fervour. The subject-matter is interestingly written, and brought fully up to date. This publication is issued in monthly parts as well as in weekly numbers.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

## APPOINTMENTS FOR THE ENSUING WEEK.

## MEETINGS.

SATURDAY,	FEB. 22	Royal Botanic Society meet.
MONDAY,	FEB. 24	National Chrysanthemum Society. Annual Meeting at Anderton's Hotel, 7 P.M.
THURSDAY,	FEB. 27	Kew Guild, Annual General Meeting in Gymnasium, 7.30 P.M.

## SALES.

MONDAY,	FEB. 24	Continental Plants, Roses, Ferns, Gladioli, &c., at Protheroe & Morris' Rooms.
TUESDAY,	FEB. 25	Imported and Established Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	FEB. 26	Consignments of Japanese Lilies, Palm Seeds, Tuberoses, Gramineal and Decorative Palms, Roses, &c., at Protheroe & Morris' Rooms.
THURSDAY,	FEB. 27	Continental Plants, Lilliums, Spiræas, &c., at Protheroe & Morris' Rooms.
FRIDAY,	FEB. 28	Orchids, from Messrs. F. Saender & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40° 3'.

On the Ascent of Sap.\*

THE problem of the ascent of sap from the roots of trees to their summits has been investigated over and over again. Many experiments have been made, and many if not more theories advanced to account for it; but to the present hour the problem is probably not considered to be completely solved by any biologist. There are two primary questions:—What is the path followed by the water? and what drives it up? With regard to the former question, we must first know whether it travels up through the interior of the cells, fibres, and vessels, or does the water pass up in the cell-walls? The general opinion has always been the former until SACHS started the theory that it passed up the walls. Botanists, however, are not now inclined to follow that eminent physiologist's view. Thus, Messrs. DIXON and JOLY, who have lately added their contribution towards the solution of the question, say:—"STRASBURGER'S experiments have eliminated the direct action of living protoplasm from the problem of the ascent of sap, and have left only the tracheal tissue, as an organised structure, and the transpiration—activity of the leaf, wherein to seek an explanation of the phenomenon."

With regard to the second question, HALE'S experiment, made in the last century, of cutting off a Vine stem near the ground, showed that there was a powerful upward pressure from the roots, inducing the well-known feature of the

"bleeding" of out or injured Vine-stems. Physiologists now call this "root-pressure." It is explained in the text-books as due to the absorption of water by root-hairs, and its subsequent transmission inwards, from cell to cell of the cortical layers till it reaches the vessels, the cell-walls being pervious to water, but not porous. A simple experiment will illustrate the effect of root-pressure, viz., of putting an inverted tumbler over some turf at night, when drops of water will be seen on the tips of the blades of grass in early morning. The next question is, how far up the stem of a tree can root-pressure act in forcing the water? The idea that it can drive it to the very top of the tallest trees—about 400 feet in the case of the giant Gum trees of Australia—is not readily acceptable. One next turns to the phenomenon of transpiration, which is always going on from all green surfaces as long as daylight lasts. Enormous quantities of water are given off under the influence of light; and we know from garden herbs that if the supply of water at the roots by absorption be insufficient when transpiration is excessive, the leaves become flaccid and droop; but how is the water supplied by the stem and branches of a tree to avoid this result in the leaves above, if the root-pressure cannot effect it? Messrs. DIXON and JOLY would confine the process of the ascent of sap to transpiration alone, for they thus write:—"Whether the draught upon the sap established at the leaf during transpiration be regarded as purely capillary or not, these experiments lead the authors to believe that it alone is quite adequate to effect the elevation by direct tension of the sap in tall trees. Explanations of the lifting of the sap from other causes prove inadequate." Again, they add elsewhere that it is their "assumption that evaporation at capillary water-surfaces is mainly responsible for the elevation of sap."

This "direct tension," to which they attribute the ascent, is elsewhere called a "tensile stress," i.e., a sort of stretching of the column of water in the vessels under the influence of transpiration; and they have to explain why the column of water is not broken in the stretching process. They attribute its coherence to the stable condition of the water, due first to "the internal stability of a liquid when mechanically stretched," and secondly, to "the minutely subdivided structure of the conducting tissue." The authors then describe their laboratory experiments to test the stability of a column of fluid subject to direct tension. Although it is not quite easy for one unfamiliar with such physics to follow them, the authors, at all events, satisfy themselves that the column of water does not get broken, under a tension of even  $7\frac{1}{2}$  atmospheres; so that under the influence of transpiration they consider the sap coming up from below to supply the place of the loss of the leaf-surfaces, to be subject to a direct tension or, so to say, a pulling force induced, we suppose, by the tendency of transpiration to form a vacuum above. This coupled with capillarity of the tracheal tubes or minute spiral, reticulated, and other sorts of vessels, is considered sufficient to explain the whole process.

Of course, experiments conducted in the laboratory may afford sufficient illustration of what goes on in Nature; but one would like to ask how does transpiration cause this supposed tensile stress; for in the experiments the authors say:—"The establishment of tensile stress is effected in the usual way, by cooling the completely-filled vessel." In Nature, however, there is no "cooling;" so it must be effective, if at all, by some other way. Consequently, one still feels doubtful

as to the power of transpiration and capillary action acting together being capable of producing this tensile stress. Is there, then, no other means of driving the sap forward in the stems and branches of trees?

Now, we cannot help thinking that KRAUS' investigations on the tensions of tissues may have something, if not a great deal, to do with the ascent of sap. A single experiment will show to what tensions a shoot is always subjected. If the outer surface be cut off in one piece from a few inches of a herbaceous stem, by splitting it down one side, and peeling it off, it will be found that, if it be fitted on again after a short time, that the central column will have not only elongated but expanded, so that the superficial piece is now too short, and its vertically out edges will not meet. Moreover, a strip of the rind tends to curl backwards, as may be also seen if a Dandelion stalk be cut into strips. This means that the outer surface has been in a state of stretch, and now contracts on acquiring freedom. Those results show that the tissues of stems are normally under great tensions. As this is intensified by turgidity, it is readily conceivable that if the turgidity be relaxed through the loss of water by transpiration above, the elastic cell-walls will contract, and tend to expel the water from cell to cell along the lines of least resistance, i.e., to the vessels, thence the water acquires a free passage upwards.

Now, as root-absorption and root-pressure continue at night in summer, when there is no transpiration going on—and again, during winter, till the leaves are formed in spring—so that a slow accumulation of water takes place, it seems to be a safe conclusion that when transpiration at the surface is resumed, a relief follows lower down, and the elastic contraction will tend to keep up the flow of water, somewhat like an india-rubber scent-spray. The tissues which get charged with water are the pith, the medullary rays, inner cortical tissue, and the young wood, up which latter the tracheæ or vascular tubes pass. The former act as reservoirs to supply the vessels or main channels of the current of sap. As absorption is always going on and transpiration also, as long as there is light, the cells of these tissues can never be absolutely at rest, but must always be expanding or contracting according as they receive or expel water.

Whether, therefore, we are justified in accepting Messrs. DIXON and JOLY'S conclusion, that "tensile stress" is all that is wanted, it is difficult to see how we can escape from those squeezing processes, as they might be called, exerted by the outermost layers of the cortex. And if the pressure upon the water passing from the cortical tissues of the root into and up the vessels be there called "root-pressure," the analogous force in the cortex and vessels of the stem and branches—which is always going on within them, constantly assisting in the upward flow—may be called "stem-pressure."

However, the problem does not seem to be by any means altogether solved; so that we must still wait for its further and complete solution.

KLUGIA NOTONIANA.—Klugia, writes Mr. W. Watson, is a genus of Gesneriaceæ, and a near ally of Cyrtandra and Streptocarpus. There are four species known, three are natives of India, and one of Mexico. *K. Notoniana* is a common plant in the Deccan and in Ceylon, at an altitude of 2000 to 5000 feet. It is a quick-growing herbaceous annual, and it is easily kept from year to year by means of cuttings. It has been grown at Kew and in other botanical gardens for many years, but owing to unavoidable treatment, it failed to attract attention until about a year ago, when, thanks to a hint from Mr. Nees, Superintendent

\* On the Ascent of Sap, by HENRY H. DIXON, B.A., Assistant to the Professor of Botany, Trinity College, Dublin; and J. JOLY, M.A., Sc.D., F.R.S. (Abstract from the Proceedings of the Royal Society, vol. lviii, 1894)

of the Hakgala Garden, Ceylon, it was tried at Kew in a greenhouse instead of a stove. The improvement in health was at once apparent, and in a few months we had plants a yard in diameter, with

half-an-inch long and wide, but those at Kew are three times larger. The stem of the plant is very succulent, and it is peculiar in having lines of hairs running down from the old leaf-scars. The form of the

uncommon plants. According to Mr. Nock, it is as abundant in some parts of the hills in Ceylon as Nettles are in England. It is made use of by the natives in curries, and as an ordinary vegetable when cooked.

FIG. 32.—KLOUIA NOTONIANA: FLOWER BLUE, WITH A SULPHUR COLOURED THROAT.

(The figure at the bottom of the illustration shows the habit of the plant; and the flower shown in the middle is double the usual size.) (See p. 235.)

leaves 8 inches long, and numerous racemes of Gentity-blue flowers, with a sulphur-coloured throat, which in appearance suggested the flowers of *Utricularia*. In the botanical descriptions of this plant, the flowers are said to be

shining green foliage and habit of the whole plant are shown in the illustration (fig. 32). The plants at Kew flowered from January till well into the summer. Treated as a greenhouse plant, it is of the easiest possible culture, and it is worth a place among choice,

**THE ROYAL HORTICULTURAL SOCIETY AND THE PROVINCES.**—When the Society took up its quarters in Victoria Street, various schemes and projects were brought forward; on the same principle as that in virtue of which six omnibuses abreast could not be driven through Temple Bar, some of these projects had to be abandoned for a more convenient season. One of these schemes was the establishment of local committees, and the appointment of local secretaries in various parts of the country. The United Kingdom was duly mapped out, and some progress was made towards indicating committees and secretaries. The records must surely exist in the society's archives, and would still serve as a basis for securing that co-operation with the provincial societies which is so much to be desired. The societies should send two or three representatives, or as many as would come, to each meeting of the Royal Horticultural Society, to attend the committee, confer with the council on important matters; and once a year there might be a general meeting of provincial and metropolitan horticulturists to discuss matters concerning the progress of horticulture in its various aspects. The need of a proper horticultural institute and exhibition-hall would then be so strongly felt, that its realisation would then surely come within the scope of practical schemes.

**SCOTTISH HORTICULTURAL ASSOCIATION.**—Syllabus for session 1896:—Feb. 4, "Points in Judging Vegetables," Mr. M. Temple, Carron House, Falkirk; March 3, "Notes on Floral Decoration," Mr. Alex. Mackenzie, Warriston Nursery, Edinburgh; April 7, "The Culture of the Maréchal Niel Rose, and Remarks on Exhibiting Roses," Mr. T. Fender, Cultoquahy, Crieff; May 5, "Daffodils," Mr. R. Shillington, Valleyfield, Penicuik; June 2, "The Hybridisation of Violas," Mr. J. Fraser, *Gardening World*, London; July 7, "Fungi," Mr. D. McIntyre, Royal Botanic Gardens, Edinburgh; August 4, "The Evolutionary Theory and Plant Life," Mr. Samuel Johnstone, Sillerbithall, Hawick; Sept. 1, "Manures and their Relationship to Plant Life," Mr. A. E. Stubbs, Ipswich; Oct. 6, "Peach and Nectarine," Mr. A. Henderson, Fullarton, Troon; Nov. 3, "Stove and Greenhouse Plants, and Structures most Favorable to their Growth," Mr. J. McIntyre, Woodside, Darlington; Dec. 1, "A Review of Scottish Horticulture during the Last Forty Years," Mr. Robertson Munro, Langeside, Glasgow. 1897: Jan. 12 annual general meeting. The meetings are held at No. 5, St. Andrew Square, Edinburgh, at 7.30 P.M. (prompt).

— The usual monthly meeting was held on Feb. 4 at 5, St. Andrew Square, the President, R. W. E. MURRAY Esq., in the chair. Mr. TEMPLE of Carron House, Falkirk, read a paper on "Points in Judging Vegetables," which, on account of the interesting nature of its contents, excited some discussion. As showing the abnormally mild conditions of weather prevailing in the north, Mr. M. CHAPMAN, Easter Duddingston Lodge, exhibited a collection of twenty-four distinct species of spring flowers:—*Lonicera fragrantissima*, *Skimma oblata*, *Andromeda floribunda*, *Berberis japonica*, *Cryptomeria japonica*, *Daphne Mezereum album*, Hazel, common; *Laurustinus*, *Pyrus japonica*, *Jasminum nudiflorum*, *Rhododendron*, two species; *Saxifraga luteo-viridis*, Winter Heliotrope, Wallflowers, Winter Aconites, Hellebores in variety, *Galanthus Elwesii* and *nivalis*; Heaths, Primroses, Crocuses, *Anemone hepatica*, and Scillas in variety.

**HORTICULTURAL CLUB.**—The twenty-first annual dinner took place on Tuesday evening, the 11th inst., and was in every respect a most successful one; there was a large attendance of members and visitors. The chair was occupied by Sir J. D. T. LLEWELYN, Bart., M.P.; and amongst those present

were Mr. Harry J. Veitch (vice-chairman of the Club), Messrs. G. Paul, Nicholson, Harbet, Bunyard, Turner, Monro, Assbee, Hogg, Becker (of Jersey), C. Pearson, Laing, and Crowley. The tables had been handsomely decorated with flowers and plants from Messrs. Veitch & Son, and with a collection of Roses by Messrs. Paul & Son, among them being that exquisite little garden Rose *Laurretta Messing*. The dessert consisting of Pine-apples kindly sent by Mr. Assbee, Grapes by Mr. Geo. Monro, Apples and home-grown Oranges by Mr. T. Francis Rivers, and Apples by Messrs. Bunyard & Sons, Maidstone, gave the tables a rich and pleasing appearance, and was much appreciated by the members. Mr. Geo. Bunyard had kindly provided for a selection of vocal and instrumental music, which was given during the evening, including solos on the concertina by Mr. Harry Turner. Mr. A. F. Barron was the special guest of the Club, and his health was proposed by Mr. Harry J. Veitch, and was very warmly received by the company.

**EALING GARDENERS' ASSOCIATION.**—A crowded audience gathered in Victoria Hall, on the 11th inst., S. A. SEWELL, Esq., being in the chair, to listen to an excellent paper by Mr. FARR, gr. to A. PEARS, Esq., Spring Grove House, Isleworth, on "Strawberries and their Culture." A good discussion followed the reading of the paper, and Mr. FARR was accorded a hearty vote of thanks.

**TRIMEROUS CYPRIPIEDUM.**—Mr. STEINMETZ, of Bruges, obligingly forwards us a flower of *Cypripedium Harrisonianum*, in which there are three sepals (the two lower being detached one from the other), two lateral petals, and a lip. The column, which is the most remarkable feature, has three shield-like staminodes, representing the outer stamens, A1, A2, A3, of Darwinian notation; and three perfect anther-bearing stamens, corresponding to the inner row, viz., A1, A2, and A3. In a paper on the "Floral Construction of *Cypripedium*," communicated to the Linnean Society in 1886 by the present writer, numerous cases of unusually-formed *Cypripeds* were noted and figured, but none exactly like the present one. We may look on this flower as a reversion to an earlier type, when all six stamens were present.

**CYPRIPIEDUM.**—Those interested in the botany of the genus will read with pleasure the paper by HENRIETTA G. FOX, in the publication known as *Minnesota Botanical Studies*, November 20, 1895. The article deals specially with the species native to Minnesota. The entire list of American species is as follows, *C. aristatum*, *C. Reginae*, *C. candidum*, *C. irapeanum*, *C. californicum*, *C. passerinum*, *C. hirsutum*, *C. parviflorum*, *C. montanum*, *C. acule*, *C. guttatum*, *C. fasciculatum*, *C. pusillum*. The structure, classification, literature, and life-history are all treated of, and there are plates of five of the species. In the same publication Mr. McDUGAL treats of the irritating effect on the skin of *C. spectabile* and *C. pubescens*. The irritation depends on the secretion of the glandular hairs.

**SHIRLEY AND SURROUNDING DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.**—The monthly meeting of this body was held at the Parish Room, Shirley, Southampton, on Monday, the 17th inst., when Mr. B. LADRAMS, F.R.H.S., presided over a good attendance. Mr. J. JONES, The Gardens, Terrace House, gave an exhaustive paper on the Peach, giving the treatment for the year as regards pruning, and touching on the planting and the diseases of the tree.

**DRIED RASPBERRIES.**—Fifteen hundred tons of Raspberries are dried on the average each year in Western New York, says Prof. L. H. BAILEY. In one county alone there are 2,200 fruit evaporators.

**NATIONAL CHRYSANTHEMUM SOCIETY.**—A meeting of the general committee was held on

Monday evening, the 17th inst., at Anderton's Hotel, Mr. B. WYNN presiding. The schedule-revision sub-committee laid the schedules of prizes for the September, October, and December exhibitions on the table, the alterations and amendments being of a slight character. The revised rules and regulations were also adopted, one main amendment being that for the future three blooms of a new variety will be required to gain a Certificate, while two only may be Commended. A draft report and financial statement were submitted and adopted for presentation at the annual general meeting on the 24th inst. The latter shows the financial position of the society to be highly favourable; and the report sets forth that 161 members had been elected during the year, and ten societies admitted to affiliation. On this occasion thirty new members were elected, and the applications from twelve societies for affiliation were acceded to. The proceedings closed with a vote of thanks to the chairman and secretary.

**FARQUHAR VIOLET.**—This, as we learn from *American Gardening*, is an American novelty, exhibited by Mr. MCKAY at the Horticultural Rooms, Boston, on January 4. The exhibitor is a grower of repute at Boston, and he exhibited on this occasion *Violeta Marie Louise* and *Lady Campbell* as well as Farquhar, all in excellent form, and grown under the same conditions. The exhibitor stated that he found the Farquhar very distinct in habit, much more prolific than *Marie Louise*, and remarkable for producing stems frequently 9 inches in length. It originated at Roselindale, and is supposed to be a sport.

**AN EXPERIMENT IN FRUIT DRYING.**—Mr. WILFRID POWELL, British Consul at Stettin, in his supplementary report on the trade of that place, says he has been informed by the manager of a Government peat-moor near Stettin of an interesting experiment that that gentleman had made with some fruit. Wishing to keep some Apples and Pears during the winter months, he thought he would try packing them in "mull"—that is to say, the dust obtained from the dry moss litter when being torn up by the "Wolf" machine. In this mull, or dust, he packed a number of Pears and Apples, enclosing the whole in a wooden case, and pressing the mull well down, taking care that the fruits were kept a little distance apart from each other. At the end of three months he found the Pears and Apples perfectly dried and as sound as those prepared for commerce by the more elaborate methods, while on being placed in warm water they began to swell out again to their former proportions. Mr. POWELL thinks that if further experiments should be satisfactory, there is a possible future in the process. Mull, he adds, sells in Germany at about 1s. 3d. per cwt., and as it is exceedingly light, one hundredweight would dry a large quantity of fruit, while it can be used again many times over, has no smell, and does not convey any taste to the fruit. It merely absorbs the moisture which the fruit contains, at the same time hermetically protecting it from the air. *Times*.

**AXMINSTER GARDENERS' IMPROVEMENT SOCIETY.**—An interesting lecture on "Parks and Gardens" was recently given under the auspices of the Axminster Gardeners' Mutual Improvement Society. The chair was occupied by the Rector (Rev. T. NEWMAN), and the lecturer was Mr. F. W. MEYER, landscape gardener to R. VEITCH & SON, Exeter. A powerful lantern, supplied by the County Council, was well manipulated by Mr. WILMOTT. Mr. MEYER exhibited about sixty capital slides, illustrating the progress of the art of landscape gardening from the earliest times.

**THE PROGRESS OF SPRING.**—But few flowers are yet to be seen in gardens near London, although the weather is distinctly less severe than

at the same date of season last year. The *Hellebores* have been given a better chance than they often have of perfecting their blossoms; and we have seen some very fine ones in the open, that in less kindly seasons must have been produced under protection, if at all. Snowdrops and Crocuses have been in bloom for some little time past, but Wallflowers and Primroses, though we saw them freely blooming in Kent a fortnight ago, are exceedingly rare nearer London. A visit to Mr. THOS. S. WARE'S hardy plant nursery, near Tottenham, showed a week ago that the *Leucojums* were as fully out as the Snowdrops; and a patch of the newer *L. carpaticum*, which is a variety or form of *L. vernum*, clearly indicated the decided superiority of the variety over *L. vernum* for creating a floral effect. The flowers are larger, and, like *L. vernum*, they are pure white, save the green markings common to these species. It differs from the type also in the height of the foliage, being much taller and more robust. The Snowdrops are less showy than the Snowflake, but not a whit less pretty; and it is interesting to see several species of *Galanthus* flowering side by side at this place. How little most of them appear to differ from each other, yet the variations are to be seen by close inspection. The new *G. Ikarie* has very broad foliage, and appears to have a robust constitution. Bulbs of this species were received from Asia Minor about two years ago. A form of *G. Elwesii* named *F. Fell* has larger flowers than the type. On the rockery, there was *Anemone (Hepatica) angulosa* in bloom, and various other early flowering plants approaching that stage. Plants of *Eremurus* species could be seen about a foot through the soil, and growth in other herbaceous plants was discernible. The bulbous *Iris* in frames were lovely. Amongst them we noticed *I. reticulata*, and the varieties *purpurea* and *sophononis*; in the last-named variety, the fall is very beautiful, and the whole flower more effective than the type. But one of the most charming of all was *I. Bakeriana*, a species that Professor MICHAEL FOSTER describes as "growing on the mountains above Mardin, on the confines of Armenia and Mesopotamia." The same high authority says that the flower closely resembles *I. reticulata*, but differs chiefly in colour, the distinctive feature being that the deep violet blade of the fall bears a central patch of creamy-white or yellow, sprinkled with dots, or crossed with veins.

**"THE COUNTRY HOUSE."**—The scope of this magazine may be guessed from its title. The articles deal with various kinds of indoor and outdoor sports and pastimes, and they are well illustrated. Among them is one on the "Essex Forest and Fairlop Oak." Now that recreation has become so much of a business, such a journal as this should find many readers. It is published at Dacre House, Arundel Street, W.C.

**SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE.**—Particulars are now to hand of the forthcoming Congrès d'Horticulture to be held at Paris under the auspices of the Société Nationale d'Horticulture de France. The meetings of the Congress will be held in the Society's Rooms, 84, Rue de Grenelle, Paris, on Thursday and Friday, May 21 and 22, at 2 P.M. The subjects noted for discussion include:—1, Grafting Potatoes; 2, Apparatus for warming greenhouses with wood, charcoal, petroleum, gas, &c.; 3, Electricity in connection with vegetation; 4, The influence of selection in budding; 5, History and cultivation of *Cattleya* and *Laelia*; 6, Practical digest of conditions favourable to vegetation; 7, Choice of trees most suitable for avenues, &c., in towns. The congress is open to other than members of the Society upon certain conditions. Communications should be directed to the President of the Society, at the above address. The organising body is composed of M. H. de Vilmorin, President; M. Ernest Bergman, Secretary; and MM. Ballair, D. Bois, Chargeraud, Honoré Dufresne, Léon Duval, Alex. Hébrand, Huard, P. Lebouf, Muesat, and A. Truffaut, members. The general secretary is M. A. Chataenay; the president, M. Léon Say.

**THE WEATHER IN THE NORTH OF SCOTLAND.**—An Aberdeenshire correspondent, writing from the shores of the Moray Firth, tells us that vegetation is very forward thereabouts; Primroses and other spring flowers are in bloom, and in the gardens Crocuses are fully blown. Snowdrops are in flower in the greatest abundance at Cullen House, while the fields are taking on their spring garb. Comparatively speaking, except in the Highland glens, there has been no "thickening mantle," and Nature has failed this year to supplement the work of the plough and harrow of the husbandman by sending frost to pulverise the stiff clays of the arable land. It need hardly be added, that there is not a little perturbation existing at present in the minds of husbandmen at this abnormal state of matters.

**GERMAN CYCLAMEN.**—The statements made by our German correspondents as to the superiority of their strain of Cyclamen, were received here with much surprise, especially by those more or less familiar with the continent. Last Tuesday an opportunity was afforded of putting the matter to the test. Some flowers of German origin, and others from an English source but grown in Germany, were shown by the side of some of the fine collections staged on Tuesday last. I should be remembered that the German specimens were cut flowers which had undergone the long journey from Berlio, and that they were taken from plants which have been continuously in bloom since November. But making all necessary allowances, it was still obvious that the specimens sent were far behind those exhibited by the home growers.

**THE ESSEX SCHOOL OF HORTICULTURE.**—The January number of the *Journal of the Essex Technical Laboratories* for January, contains an illustrated article on pruning, which might profitably be read by all young gardeners. The three weeks' instruction in horticulture for young gardeners, comprises lectures, laboratory work, work in the greenhouse, and visits to nursery establishments. The students are kept at work from 9 in the morning till 8.30 in the evening, with intervals for meals. The first week's instruction is particularly devoted to the propagation of plants, the second week to fruit culture, the third week to flower culture. Three weeks is a fractional period of time to be devoted to teaching horticulture, but the course of practical work with explanations and demonstrations is long enough to give pupils an idea of how to work, and what to work at. In most cases, students are overwhelmed with the amount of study expected from them—they do not know how or where to begin. A little judicious help, such as is given by this practical class, will greatly diminish these difficulties and enable the pupils to "run alone."

**COLTSFOOT.**—We observed expanded flowers for the first time this year on February 12. In former years the dates were as follows:—1890, January 24; 1891, February 15; 1892, February 10; 1893, February 13; 1894, January 26; 1895, February 15.

**CORNELL UNIVERSITY.**—The special advanced students who are fitting themselves for professional horticulturists, meet weekly at Professor BAILEY'S residence, Ithaca, for the purpose of discussing in a social and informal way the current events of horticultural importance, or matters of history and criticism. There has never been such a gathering of mature and trained men for explicit horticultural study in the United States as is now in attendance at Cornell. Lately the gathering discussed "The Emphatic Points in New York Pomology." Another time the topic was "The Lindleys, their Times and Work." Other reflective topics for the term are "The Rural Life of Thomas Jefferson," "The Downings," "Sketches of the Life and Times of Arthur Young," "Jethro Tall, and the Tillage of Land," "Thomas Andrew Knight." The students comprising the social seminary are mostly professors of the State colleges, or qualifying for such positions.

**WYE COLLEGE.**—It is gratifying to see the progress that is being made in this and similar establishments. The *Journal of the South Eastern Agricultural College* shows that a healthy influence is at work, and we cannot doubt that influence will deepen as well as spread as time goes on, and by-and-by we shall come up with our American and Continental friends.

**INTERNATIONAL HORTICULTURAL EXHIBITION AT HAMBURG, 1897.**—It is the intention to celebrate the sixtieth anniversary of the existence of the Hamburg-Altona Societies, by holding a general horticultural exhibition next year, at Hamburg. The exhibition committee have the power to elect its own members as occasion may require, and the formation of sub-committees in other German as well as foreign states and towns, is under consideration. The exhibition will cover the entire field of horticulture, and represent plant cultivation of every kind; and it will be open to everyone, of German or non-German nationality, to participate. All questions relevant to the classification of articles for exhibition rests with the committee for decision; but all articles of a purely horticultural nature will, on principle, be freed from all entry charges, and charges for standings; whilst it is proposed to make charges for manufactured articles. The permanent exhibition opens May 1, and remains open, if the weather will permit, till October 1. Forming part of this permanent section during spring, summer, and autumn, there will be planted in the open air, trees and shrubs, avenue trees, collections of deciduous shrubs and trees, Conifers, evergreens of all kinds, Rhododendrons, Azaleas, herbaceous perennials, annuals, &c. The permanent exhibition in the buildings begins on May 15, and will consist of plants in pots and beds, cut flowers, fruit, to which particular attention will be paid; vegetable, garden plants, tools and implements, seeds, so far as these exhibits must be brought under cover. There will be special exhibitions in the spring, lasting five days; in the summer, lasting eight days; and in the autumn, lasting eight to ten days. The State has been approached on the subject of granting the land lying east of, and near to Heiligegeistfeld, between Millerthor and Holtenhor, as the site for the exhibition buildings, and permission to make use of this land is looked for with confidence.

**PRIMULA "BOUQUET."**—Messrs. CARTER & Co. send us flowers of a variety of Chinese Primrose, which they are sending out under the name of "Bouquet." Any one who looks at the calyx of a Chinese Primrose will see that it is of a markedly leafy character. Exaggerate this tendency till you have a calyx nearly 4 inches across, elegantly lobed and fringed, and some idea of Messrs. CARTER'S Primrose may be obtained. The corolla is 1½ inch across, white, flushed with rose, and with overlapping deeply-fringed petals. This leafy condition of the calyx is of frequent occurrence—instances of it have been figured in our columns, and we have urged our growers to "fix" the peculiarity. This, Messrs. CARTER assure us, they have now done. The habit is good, it is a robust grower, flowering freely in the early part of the season as single blooms, and later on in large trusses.

**SUNDERLAND GARDENERS' SOCIETY.**—A meeting of the members of this Society was held at the Café, Fawcett Street, on Wednesday, the 12th inst., Mr. J. T. RICHARDSON presiding. Mr. USHER, gardener, Somerleyton, read an interesting paper "On the Culture of the Azalea indica," giving its history, propagation by seeds, cuttings, and grafting, the best time for potting, suitable soils, &c.; pruning and training; also dealing with insects which infest them, and the means for their destruction. Considerable discussion took place, to which Mr. USHER replied; and a hearty vote of thanks was given him for his valuable paper.

**FLOWERS IN SEASON.**—We have before us a few flowers of varieties of *Primula sinensis*, received from Messrs. JAS. VEITCH & SONS, Royal Exotic

Nursery, Chelsea. They represent a strain that is being selected for seed-saving purposes, and notwithstanding the excellence of *Primulas* generally at the present time, the blooms are worthy of remark. One of the most distinct is Veitch's New Salmon, a comparatively new shade of colour in *Primulas*; Chelsea Rose, Chelsea Scarlet, Gigantic Red, Superb White, and Chelsea Blue, are good flowers of the respective colours, and there are semi-double varieties in red and rose.

**PUBLICATIONS RECEIVED.**—*Bulletin of Miscellaneous Information*, Royal Botanic Gardens, Trinidad, for January, including articles and notes on *Adrua* (*Cyperus articulatus*); *Pennisetum orientale* as a fodder-grass; *Lantana burbonica*, fibre from *Acrocomia sclerocarpa*, botanical notes, &c.—From the Cornell University Agricultural Experiment Station: Horticultural Division; *Bulletin* 95, Winter Muskmelons, by L. H. BAILEY; *Bulletin* 96, Forcing-house Miscellanies, by L. H. BAILEY and E. G. LOEMAN; *Bulletin* 97 (Botanical and Entomological Divisions), Studies in Artificial Cultures of Entomogenous Fungi, by R. H. PETTIT; *Bulletin* 99, Blackberries, by L. H. BAILEY; *Bulletin* 100, Evaporated Raspberries in Western New York, by L. H. BAILEY; *Bulletin* 101, The Spraying of Trees, by L. H. BAILEY; *Bulletin* 102, Respecting the Care of Fruit-trees, by L. H. BAILEY; *Bulletin* 103, Soil Depletion in Respect to the Care of Fruit-trees, by J. P. ROBERTS; *Bulletin* 104, Climbing Cutworms in Western New York, by M. V. SLINGERLAND; *Bulletin* No. 106, Revised Opinions of the Japanese Plums, by L. H. BAILEY.—*Insect Life; A Short Account of the Classification and Habits of Insects*, by F. V. THEODALD (METHUEN & Co.).

## PLANT PORTRAITS.

APPLE, PRÉSIDENT BEBUYCK, *Bulletin d'Arboriculture*, &c., January.

CYPRIPEDIUM INSIGNE LUCIANI, apparently approximates to the variety known as *Sanderi*. *Illustration Horticole*, t. 49.

DRACENA RIGOUTSI, De Bouschère, *Illustration Horticole*, January 30.—A variety of *D. australis*. Leaves striped with yellow.

HELICONIA ILLUSTRIS VAR. RUBRICAULIS, *Revue Horticole*, January 16.

HEPATICA TRILOBA, *Mechan's Monthly*, February.

HIMELASTRUM BRACHYANDRUM, *Garden*, Jan. 11.

## KEW NOTES.

**ANTHURIUM CHAMBERLAINI.**—The only examples of this plant are at Kew and in the garden of Mr. Chamberlain at Highbury. Hitherto, it has refused to ripen seeds, but there is now a fine fat spadix rapidly approaching maturity on the Kew plant, and I saw a likely looking spadix on the Highbury plant a weeks ago. Mr. Chamberlain has succeeded in crossing *A. Andréanum* with *A. Chamberlaini*, at any rate he has a number of seedlings in which the leaf characters are a combination of these two species. One of these seedlings is now in the Kew collection.

## ANTHURIUM GUSTAVI.

This is the largest-leaved *Anthurium* known, and a fine specimen of it may now be seen in the Victoria-house bearing four leaves, with petioles 3½ feet long, and cordate blades 4 feet long, and 3 feet wide. It is in flower, the spathe and spadix being 11 inches long, erect, and of a black-purple colour. A figure of this species was recently published in the *Botanical Magazine*, t. 7437. It is a native of Colombia, and has been cultivated at Kew since 1887. The large specimen here noted was presented by Messrs. F. Sander & Co., two years ago.

## THE ORIGIN OF THE GENUS CINERARIA.

The "hybrid" shown by Messrs. J. Veitch & Sons at the Drill Hall on the 11th inst., under the name of *C. langleyana*, is an interesting contribution towards the solution of the question whether the garden *Cineraria* is of hybrid origin, or the result of cultivation and selection from one species, namely, *C. cruenta*. Messrs. Veitch crossed the last-named species with the garden varieties, and obtained what

they call *C. langleyensis*; a similar cross was made at Kew with identical results, as may now be seen in the conservatory there. It is impossible to distinguish these crosses from ordinary garden *Cinerarias*, except that they are a little taller than the most approved strains, and the flowers looser. Any one ignorant of their origin would unhesitatingly dub them an inferior strain of the ordinary *Cineraria*. On the other hand, we have at Kew crosses between *C. Heritieri* and the garden *Cineraria*. It will be remembered that those who favour the hybrid theory with regard to the origin of the garden *Cineraria* say that *C. Heritieri* is one of the parents. But the crosses between these two are very different from any garden *Cineraria*; moreover, they are undoubtedly perennial. The conclusion forced upon one by these crosses is, that if *C. Heritieri* was ever used by the early breeders of garden *Cinerarias*, it was soon bred out, and that the relationship between them and *C. cruenta* is so close that no breeder would hesitate to accept the latter as the sole progenitor of the garden *Cineraria*.

#### DENDROBIUM SARMENTOSUM.

Mr. Rolfe has given this name to a new species, which flowered at Kew in May last, and is in flower again at the present time. It has proliferous, thin, pseudo-bulbs, not unlike those of the thin form of *D. Falconeri*; the flowers are freely developed on the leafless pseudo-bulbs singly or in pairs from the axils; they are 1 inch across, with equal sepals and petals, a short, nearly straight spur, and they are white, with a yellow blotch on the throat, and a few red lines on the lateral lobes. Their principal charm is in their odour, which is as powerful and pleasant as that of *Viola*s. The species is a native of Barma. A figure of it will be published in the *Botanical Magazine*. Messrs. Low & Co. showed a plant of it at the Drill Hall last week under the provisional name of *D. fragrans*.

#### DENDROBIUM RUCKERI.

Plants of this Philippine *Dendroba* are now in flower at Kew, where they were received some time ago under the name of *D. amœnum*. The habit is that of *D. luteolum*; indeed, these two species might be mistaken the one for the other when out of flower. The flowers are axillary on the newly-matured pseudo-bulbs, singly or in pairs,  $1\frac{1}{2}$  inch across, pale yellow, with a few faint lines of rose colour on the side lobes of the lip, and a prominent hairy ridge down the middle of the central lobe. The plant was named by Dr. Lindley in 1843, when it flowered in the collection of Mr. Sigismund Rucker, at Wandsworth.

#### ÆAÏDES VANDANUM.

This plant is a success only when grown in the cool-house, at any rate, this is the case at Kew, where it has been grown several years in a shaded corner of the *Odontoglossum*-house, and that it enjoys this treatment is shown by its branched, long stems, well furnished with leaves springing from a sphagnum-moss cushion, attached to a piece of tree-fern stem. It is now bearing fourteen perfect, white, curiously-formed flowers.

#### ADONIS AMURENSIS.

Plants of this new introduction are now in flower in the rock-garden and the herbaceous-ground at Kew. It is a native of Northern China; but, according to a Japanese work, it has long been a garden-plant in Japan, and is known to vary considerably in the size and colour of its flowers. It has the habit of *A. pyrenaica*, and yellow Buttercup-like flowers  $1\frac{1}{2}$  inch across. A figure of it will be published in the *Botanical Magazine*.

#### TRIAS PICTA AND T. VITRINA, &c.

the latter a new species last year, are now crowded with flowers. I may note that *Selenipedium Sargentianum* has a scape  $2\frac{1}{2}$  ft. long, bearing a yellowish-green, red-margined flower, and showing a very close relationship to *S. Lindleyanum*. *Dendrobium Hildebrandi*, with flat pseudo-bulbs, 2 feet long; leathery leaves, 4 inches by  $1\frac{1}{2}$  inch; and clusters of dull pale yellow flowers, does not in this form deserve to rank with first-rate *Dendroba*s, *W. W.*

### MR. S. T. WRIGHT.

We have pleasure in presenting a portrait of the new superintendent at Chiswick, from a photograph executed last week for this purpose. Mr. Wright commenced his horticultural career in 1870, in the gardens at Snelston Hall, Derbyshire, under the late Mr. Macpherson, and upon the decease of that able gardener, remained two years under his successor, Mr. Allan. On leaving Snelston he entered the well-known gardens at Alton Towers, Staffordshire, under the late and much-respected Mr. Rabone. Mr. Wright left these gardens to take the position of foreman at Woodseat, near Uttoxeter, with Mr. Neer, and afterwards with Mr. Hollingworth, now gardener to Lord Tredgar, near Newport, Monmouthshire.

After nearly three years' service at Woodseat, he was appointed gardener to C. B. Kingdon, Esq., Edgaton Lodge, Derby, a position which he retained for six years. Mr. Wright then left Edgaton to take over the management of the gardens of C. Lea

MR. S. T. WRIGHT,  
Superintendent of the Royal Horticultural Society's  
Gardens, Chiswick.

Campbell, Esq., Glewston Court, Ross. How he succeeded in developing the suitability of these gardens for first-class fruit culture is now well known, but it may be added that during the ten years he was there he won upwards of 700 prizes at exhibitions in Great Britain, and these were principally for fruit and vegetables. It will be remembered that in his prize essay upon "The Commercial Aspect of Fruit Culture in England," read at the Royal Horticultural Society's fruit show at the Crystal Palace, Mr. Wright gave astonishing figures, which proved that for Apples and Pears of the highest quality, first-class prices were regularly obtained. Mr. Wright, therefore, takes to Chiswick an abundance of practical experience upon the cultivation of fruits and vegetables; and combined with this a genial, unobtrusive disposition, that will assist him greatly in the rather peculiar and prominent position he has now to fill. We believe he will prove a worthy successor to Mr. Barror.

## NOTICES OF BOOKS.

WELLS' BOOKS ON THE CULTURE OF THE  
CHRYSANTHEMUM. (W. Wells, Earlswood,  
Redhill, Surrey.) Price 1s.

This is a small, concise guide to the cultivation of the *Chrysanthemum*. Other good works upon the same subject have been published, but the

author believes that the present one will be acceptable on the ground that it is more general in its treatment of the subject. Information upon the best culture of the plant for decorative purposes, and hints to amateurs or cottagers, we are told in the preface, have not been previously given. Nevertheless, the exhibition spirit runs through the work, and the culture of exhibition blooms, best methods of preparing, staging, and even of judging them, are given according to the author's experience. In the preface, and in a "Free Chapter not Charged for in the Book," there is an attempt to explain the author's position in regard to the competition he has entered into with gardeners during the past two years at exhibitions. His "object being to write this book," he wished to obtain experience in that matter. The explanation was unnecessary, inasmuch as the exhibits were made in open classes. Readers of the book are asked to excuse trifling grammatical errors that may be found, on the ground of the author's horticultural rather than literary education. As far as methods of cultivation are concerned, the work is thoroughly practical, and the information afforded is eminently trustworthy. Various other subjects, such as the best to select of the many varieties now obtainable, the qualities and points of the different forms of the flower, and other matters, are discussed, and the opinion of the author upon each is given. With some of this debatable matter we cannot agree. For instance, while accrediting the National Chrysanthemum Society with the sole right to award Certificates to new varieties—and thus questioning the title of the Royal Horticultural Society to deal with such matters—the author is not prepared to trust the National Society to declare to which section a new variety may rightfully belong. If the society is not capable of the latter work, how can it be of the former? A humour of a certain kind breathes through the whole of the matter, and the reader will learn what is meant by a "tickle" with the syringe, and a "flick over" with the watering-can. When the author speaks of stimulants, we are told that "farm-yard (manure) is real food, like beef-tea;" "but nitrate of soda is only stimulating like whisky to a tired man."

There are upwards of a dozen photo reproductions, several of which are instructive, whilst it is difficult to see what end can be served by some of the others. The book is cheaply got up, but the type is clear and easily read.

AN INTRODUCTION TO THE STUDY OF SEA-WEEDS. By George Murray, F.R.S.E. (Macmillan & Co.)

The study of Sea-weeds possesses peculiar fascinations. Their beauty and variety, the localities in which they grow, the interest attaching to collecting them, invest these plants with special interest. That interest is wonderfully enhanced when the collector becomes a student, and traces out for himself the details of their structure and life history. These, in many cases, show him structures reduced to its simplest elements, and function unobscured by secondary processes or complications of conformation. In this way these plants often foreshadow the structure and physiological arrangements of the higher plants, and, indeed, lead to the inference that the latter may be the lineal descendants of the *inutile* *Alga*. Mr. Murray is well fitted to undertake such a work. He has had much experience both in the herbarium and on the coasts of various countries; he has the resources of the Natural History Museum at his disposal, and, above all, he has the critical faculty and a carefully-trained judgment. The introduction is particularly interesting to the student desirous of obtaining a general view of the subject, and as it is followed by a select bibliography, further information is easily obtained if desired. There are numerous original illustrations, which are really what they purport to be, and which are well executed. The coloured plates are not so satisfactory as the others. We cannot in these columns enter into

details as to the details of classification of a series of plants that have relatively little interest for gardeners. The comparative uniformity of the conditions under which these plants exist in the several climatal areas of the globe supplies suggestive hints for the general cultivator—hint, of course, of even greater value to those who have the management of aquaria. "In the culture of Sea-weeds in aquaria, it has been found that forms from deep water are peculiarly susceptible to rise of temperature and undue illumination, so much so, that merely for their transport it is necessary to choose a cloudy day, especially if in summer, and the use of ice is almost always advisable. A cool chamber from which direct sunlight is excluded is a condition of success in the culture of most Sea-weeds. One way in which these plants may be killed by too much care is in the attention paid to the aeration of the water. Very little is necessary, since the air so introduced

on retiring from business, resided at Colbrook Lawn, near Slough. The bush of Pomona, the subject of our illustration (fig. 34) is growing in the gardens of East Sutton Park, Staplehurst, the residence of Thomas Oliverson, Esq., and the photograph from which the figure was prepared was kindly sent by Mr. W. Lewis, the gardener at that place.

CULTURAL MEMORANDA.

DENDROBIUM WARDIANUM.

In reply to "Anxious," (*Gardeners' Chronicle*, February 1), I cannot say that my treatment varies materially from that followed generally by gardeners. I advocate teak baskets in lieu of pots or pans for this particular species, placing the plants in small rather than large baskets, crocking

temperature and a drier atmosphere. The temperature during the resting season should be 50° to 55°, as I find they flower better than when subjected to a low temperature. The foliage should be kept for as long a time as possible, as so doing retards second growth very materially. No syringing is needed until the growths are 1 foot in length, and then only lightly spraying. If this practice be adhered to, no growths will rot off; and I have never known a single instance of their doing so. *James Hobden, Welham Hall, Retford, Notts.*

CÆLOOYNE CRISTATA.

This beautiful winter-flowering Orchid is, as is well known, easy of cultivation, either in small or large pots, shallow pans, or wooden baskets. In the latter it is useful for hanging about in apartments, where it may remain for a considerable length of time without injury, provided much water be not

FIG. 34.—APPLE COX'S POMONA: AS GROWN AT EAST SUTTON PARK.

has been found to carry off too much carbonic acid. A sudden change of water is also mischievous, and added water (whether fresh water to make up for evaporation, or salt water) should be supplied drop by drop."

A BUSH OF COX'S POMONA APPLE.

As most of our readers know, Cox's Pomona is a showy, late autumnal variety, good for culinary, and not unfitted for dessert purposes, and cropping heavily in favourable seasons—at least, in the southern parts of the country. The fruit is rather above the middle size, somewhat oblate, angular at the sides, with protuberances round eye cavity. The skin is yellow, streaked with crimson, and fully-exposed fruits are entirely of the latter colour, marked with patches of darker shade. The flesh is white, tender, juicy, and of pleasant acidity. The habit of the tree is rather sparse and erect, making it an admirable tree for orchards under grass, which are fed off by horned stock. The raiser of this variety and of Orange Pippin was a brewer named Cox, who,

with fairly large crocks and charcoal, and three parts peat and one of sphagnum-moss, firmly wedging in each plant. If any plant does not thrive after flowering, re-basket it. I re-basket the worst of mine every year, and reap the benefit of so doing. Those of my plants re-basketed in 1894 made almost double the length of growth in 1895 that they had done previously. It is essential that the growths should all hang over one side of basket. Put two wires across the corners of the basket to suspend the baskets, and the growths will then hang down as in their native habits. The temperature during the summer should be about 65° to 70° Fahr. Watering is of vital importance, and soft water should always be used. Little moisture is required in the early stages, but as growth proceeds gradually increase the quantity, affording aid to growth by weak liquid-manure made from cow and horse-dung, and occasionally weak soot-water. It is impossible to give the plants too much light; ventilation on the other hand should be carefully applied, and shade afforded by means of roller-blinds. As growth finishes up, reduce the supply of water at the root, and stimulants also by degrees gradually hardening off the plant to a cooler

afforded. When large 60-sized pots are used *Cælooyne*s are useful for dinner-table decoration, or for filling small vases. As cut flowers, there is nothing more valuable for the making of bouquets, their large showy blooms being easily wired and manipulated, and they will withstand the heat of a crowded room for a considerable time without drooping. I find that their cultivation demands, during the summer months, the temperature of the Cattleya-house, but they will grow with other plants in an intermediate-house; and during the early winter months, a temperature of from 55° to 60° must be afforded them. After the new year, they will benefit by being placed in a higher temperature, so as to bring them early into bloom. When grown in large pots or pans, care should be taken to have plenty of drainage materials in the form of clean crocks, and a potting compost of good fibrous peat and sphagnum-moss.

CÆLOOYNE FLACCIDA

should be grown in pots or baskets, the form being handy when the plants have to be employed in apartments. Like *C. cristata*, a native of the lower

zone of the Himalayan range, and discovered by Wallich, it is a mountain plant, indigenous to Nepal, liking plenty of heat during the summer months, and cool treatment during the early winter months. *C. flaccida* grows well in a mixture of fibry Orchid-peat and sphagnum-moss. The racemes are of considerable length, pendulous, and many-flowered. I have found the flowers either on the spikes or wired of use in the making of bouquets, but their odour is rather against them. *B. W.*

## HOME CORRESPONDENCE.

**JASMINE FRUITING**—I have had here a similar experience to Mr. A. Batcher (see p. 205) respecting the fruiting of this old garden plant. A large bush growing on the south side of my house produced several bunches of fruits in 1893, a time when its fruiting was new to me. But fruiting again in 1895, I concluded it was more common than I had imagined, and that I must have overlooked the fact in previous years. The fruits are of oval shape, and quite black, darker even than a fully-ripe black Currant. The greatest number of fruits on any truss was three, but there was no general fruiting of the plant, only a cluster here and there. *E. Jenkins, Hampton Hill, Middlesex.*

**DAFFODILS GOING BLIND.**—It seems to me as if your correspondent "A. D." has misread the mark concerning Daffodils going blind. My previous note was intended to show that the term "blindness" is quite a misnomer, because experience has proved over and over again that no matter what is the treatment the bulbs receive, indoors or out, the flower in some form or another will come out, if it exists within the substance of the bulb. The term "blind" has been used by unscrupulous dealers as a sort of defence for an inferior article failing to flower at all. But if the flower germ had ever been in the bulb, it must come out somehow, for it cannot evaporate into this air. And this same law applies with equal force to a perfectly or imperfectly formed bud, for when growth begins, the bud will follow. It is only the inexperienced who try to rush these bulbs into flower by placing them in a strong heat, and the chief result of it is not blindness, or anything akin to it, but the heat has retarded the flowers, particularly such varieties as are not suited to hard forcing, e.g., the common Lent Lily, *Narcissus biflorus* and ornatus, when put in heat too soon. This is always obvious when at length the flower-spikes come away as the stem is usually crippled. What "A. D." erroneously terms a malady, has nothing to do with disease whatever, and is purely imperfect bud formation, which may occur in the healthiest bulbs when these are under a seed. Most of the largest growers when forcing these Daffodils, put them first into a cold house, having full air on, and then by degrees the house is closed, and eventually heat is applied. The heat is increased when growth is well started. This system has more to recommend it than moving a few tons of soil and bulbs from house to houses twice or thrice. And well-managed market-growers' houses have crops usually marked out for them in advance. *J.*

**FRUIT-FARMING**—I think farmers wishing to try fruit-culture must be somewhat puzzled to know how to proceed, and I cannot agree with either "A. D." or "W. P. R." as to planting. It is no use advising a man how he is to invest his money when he has not any. In the first place, if the capital is non-existent, how can he obtain the labour to gather in his crops? And the next question is—How far is the land from a railway station? If the land suits both, I should plant top-trees, with bushes between, at 5 feet apart, the top-trees being 15 feet apart. Apple trees of three years old, with every root cut back, very rarely form tap-roots; and the removing of some varieties, not only stops all growth for a season, but the fruits which come are deformed for several years in some instances. With Plums the case is different, and I prefer lifting to root-pruning them. On heavy land, instead of digging holes and filling up with good soil, I should prefer to plant nearly on the top, and use the good surface-soil to cover the roots with. In most cases the steam-cultivator should be used to break up the land, it being the best and cheapest implement. Two, or at most three, varieties of Apples, three of Plums, two of Gooseberries, are enough to plant, and I strongly advise Pears being left out. I have found Gooseberries to pay the best

of all kinds in the long run, and manuring to be the more effectual if applied as soon as the fruit is gathered. *W. C. Smythe.*

—I do not think "W. P. R." can have had much experience in lifting four-year-planted fruit trees, and re-planting them, doing so carefully, or he would not assert that the next year they would bear no fruit; as that is so very wide of my experience, if the trees have previously set fruit-buds. If they have not, no other treatment will induce them to produce fruit next season. Such a careful lifting and re-planting done early in the autumn, forms the very best methods of root-pruning. But again, "W. P. R." seems to be just as much at sea with respect to the objects of root-pruning. In this case the work needs to be performed only when the trees make gross growth and become fruitless. To check that exuberance, lifting is the best corrective, re-planting immediately; or when that is not practicable, then systematically root-pruning. But to assume that such root-pruning is furnished by the opening of a deep trench between the rows of trees for Celery, turning into it a specially heavy body of manure, finally earthing-up the plants, and then cutting down a smooth perpendicular trench of soil 3 feet from the trees, and above all things, during the particular season of root-activity, is indeed a strange proceeding. Why, the effect is to drive the tree roots deeper into the soil, and to send them beneath the trench thus made by the Celery earthing, to feed grossly, too, on the manure under the Celery plants. Again, what becomes of such assumed root-pruning after the Celery is removed, and the soil levelled? Why, the roots redouble their feeding force, and the last care of the trees is far worse than the first. Plant Strawberries or sow Spinach, or other shallow-rooting vegetable crop, if you will, but spare the trees such extraordinary treatment as is found in the root-pruning through the aid of Celery culture. *A. D.*

**RULES ON JUDGING**—We, the gardening fraternity, are much indebted to the committee of the Royal Horticultural Society for the effort put forth in framing a code of rules for judging, and suggestions to exhibitors-makers for adoption by horticultural societies. Promoted under the best auspices, and formulated by men of the greatest eminence in horticulture, such a code ought to be accepted, and its rules universally honoured and obeyed. That this happy consummation might be reached, the committee have invited suggestions of improvement, and the correction of errors, which in the initial circumstances, could scarcely be avoided. Granting me a very small space, I would draw the attention of the committee and others interested to paragraphs 49 and 50—judging miscellaneous collections of fruit. The relative importance of the various kinds is set forth in a scale ranging from ten to three points, these figures being the maximum number of points a lot is in competition for a perfect dish of its kind, with the exception of Grapes, which I notice further on. I find no fault with the proportion relatively between the kinds, but I fail to see how the value of the two factors could be allocated during a judication. If all the opposing dishes in competition consisted of the same kinds and varieties, it would be a simple matter to accord full value to each if perfect; but how few dishes do we find in collections in that condition! Then anything short of perfection—a term not easily defined—would be reduced by, say, one or two points, and no person but the judge would know whether the reduction was due to a defect in cultivation or to his estimate of relative value. Cultural and natural or relative value, being two distinct elements should be estimated separately, and the value recorded in different columns. That the skill of the cultivator be appraised at its proper worth, the relative value should be estimated at a mere fraction, say, one-quarter, one-fifth, or one-sixth of the cultural value. In my opinion, the committee have failed in settling a most important and pressing question, which has been a trouble to exhibitors and judges for many a day. In dealing with single specimens of vegetables, plants, and flowers, relative value is strongly in evidence—too much so for some people—for what is "quality," "intrinsic worth," and "difficulty of cultivation" but some of the factors which constitute relative value? In regard to the Grapes, Muscat of Alexandria is allowed ten points—how much of this is relative value? other white and black Grapes nine points, thus placing the best varieties of black on an equality with the coarsest varieties of white. This

is certainly an oversight. Hamburgh and Madresfield are of far more value relatively than Trebbiano or White Nice, and a list of the varieties generally cultivated, with their relative importance, is an omission which no one would have anticipated. I think the general opinion will be in favour of a revision of the method of judging, and a standard of relative value fixed, especially applicable to mixed collections, where it is most needed; then we may expect to see judgment administered according to law. *Judea.*

**FREESIAs.**—Mr. Gumbleton writes:—"After more or less patient waiting for nine years, some bulbs sent me by Professor Foster as *Freesia refracta*, true, the type form figured by Redouté in vol. vii. of *Les Liliacées*, t. 419, as *Gledicius refractae*, are at last going to bloom with me for the first time, much to my joy, as I really hardly ever expected to see them. From the picture, the flower is most certainly a *Freesia*, but the foliage is much more narrow, and altogether different in appearance to that of the ordinary *F. Leichtlinii* form, or any other I know, and I think I have now in my collection all the varieties that are in cultivation, or that I have ever heard of—some eleven or twelve in number. The Professor's plant also differs from all other *Freesia*s in its slowness of increase, as when any other kind, of which six bulbs sent me in '87 would by now have stocked at least a dozen pots for me; of this, I have still but the original one pot, the bulbs having slowly increased in size, but hardly, if at all, in number. The white *Freesia* is commonly known as *refracta alba*, but has, I think, no right to the name of *refracta* at all, being only an albinism of *F. Leichtlinii*."

**TIMBER OF THUIA GIGANTEA.**—Your correspondent (p. 200) is wrong in supposing that the timber of the giant *Arbor-vitæ* has not been introduced to this country. Further—thanks to Professor Macconn, I was enabled to compare home-grown with imported timber at the late Colonial and Indian Exhibition, a full account of which was given in the *Gardeners' Chronicle* at the time. *A. D. Webster.*

**PARSNIPS AND PIPES.**—I send you a photo of a Parsnip that was grown in co. Armagh. You will perceive that the seed must have settled upon the bowl of a clay tobacco-pipe in which there was a hole, which allowed the roots to pass into and through the bowl. The Parsnip is now, of course, much shrivelled, but when it was fresh it was much swollen above and below the pipe. *Thos. Carroll.*

**POTTING SOIL.**—So great is the quantity of this material consumed in some of the large plant-growing establishments, that it is difficult for townfolk at times to find suitable soil. Sometimes builders drop upon good stuff in excavating for buildings on an old pasture, but very much depends on the texture of such soil. I saw recently at one of these establishments a heap of some 300 loads of what seemed to be a perfect yellow loam, the furves 6 inches thick, and full of fibre. This was an unusually good piece; but it so very frequently occurs that the soil though full of fibre, is yet very loose or sandy, and has little cohesion. Still, the best has to be made of everything, and nothing is wasted. Soil is often used over again; what has served for *Chrysanthemums* or other soft-wooded plants after lying for a year or more in a hop-biog mixed with one-third fresh soil and some well-rotted manure, is used again for *Petuniums*, *Tomato*, or other things. Soil from *Roses* or other hard-wooded plants that may have been in use too long, serves for top-dressing, but it is poor stuff for re-potting. The requirements of an ordinary private garden seem hard to meet, but what must be the demand when the glasshouses cover vast areas, filled with plants, whose numbers are reckoned by hundreds of thousands—and where cut flowers are extensively produced, and the pots are large also. It is also not one, but hundreds of these market establishments within easy distance of the metropolis that have to be served with good soil. What hope is there that over any material can become a proper substitute for good yellow tarry loam? *A. D.*

**HARDY FERNS IN EXPOSED POSITIONS.**—I have read with much interest the extracts from Mr. J. D. Nares' paper on "Wild Gardens and Pleasure-Grounds," which appeared on p. 107, in which I was very glad to see that he recognised the value of hardy Ferns in that connection. I cannot help thinking, however, that a slip of the pen has occurred in the sentence, "There is no place

too bleak or exposed for them." True, we find many species holding their own in bleak and exposed situations, and thriving there in a certain rugged fashion, just as we may find old walls covered with *Cerastich*, *Scelopendrium vulgare*, and several species of *Asplenium* by the sides of wind-swept and dusty roads, and subjected to conditions of drought which render their existence there a marvel. If, however, we turn into a shady, sheltered lane, where precisely opposite conditions obtain, instead of small stunted plants with little or no beauty to recommend them, we shall find even the sun-loving *Cerastich* twice or thrice the size, while the Hart's-tongue will be represented by grand specimens, with fronds a foot or two long; *Asplenium*, *Adiantum nigrum*, a foot high, and every other species we may have observed enhanced in beauty as well as in size in a similar fashion. Passing along a nondescript moorland path we shall probably find robust clumps of *Luzula* and *Athyrium* lining the wayside in profusion; and as regards vigorous health, I grant there may be no fault to find, but wait until we come to a secluded glen, roofed in by trees, and even in the roughest gale, the home of nought but gentle zephyrs. It is here, and here alone, that the lady and male Fern, broad mountain Buckler Fern, Hard Fern, and others are seen in their true beauty and full development. The same observations apply with equal force to exotic hardy Ferns, since the whole family, with such few exceptions that they may be ignored in this connection, revel in shady nooks and conditions of constant aerial humidity, which even in the more favoured spots in our British Isles, a "bleak and exposed position" debars. If, then, this be Nature's teaching, in connection with the normal forms to which Mr. Nancarrow's observations apparently refer, and which, as a rule, are more robust in structure than the varieties, how much more does it apply to such wonderfully delicate forms as are many of our best plumose and crested types, which are no more fitted to stand bleak winds or exposed positions than a lady's ball-dress is suited for a cross Channel passage in a south-westerly gale—rags and tatters in both cases would be the result. "Nothing," as Mr. Nancarrow truly says, "can be more graceful or refreshing to the sight than a collection of healthy Ferns, and one need never tire in admiring the individual beauty peculiar to each separate variety," but to arrive at this we must supply conditions to fit, and those, according to my experience, are essentially such as ensure constant protection from bleak winds and exposure to the sun. *Chas. T. Drury.*

**CACTUS DAHLIAS.**—Your correspondent, "A. D.," p. 131, says that Cactus Dahlias are scarcely effective as garden plants—a statement which is scarcely correct; whereas, they are in my opinion the most elegant of the Dahlia family. It is true that some varieties, having delicate and beautiful colours, hide their flowers in the foliage, such as Countess of Goring, Countess of Radnor, Delicate, Kynerith, and others of that type, but there are plenty of varieties which throw up their flowers on strong foot-stalks, after the manner of *Matchless*. Most of the varieties named by your correspondent have good points, but some of the older and less expensive varieties are equally good as decorative plants, and for furnishing flowers for cutting, vases, &c. Among the best that I myself have grown are *Juarez*, *Mrs. Hawkins*, *Lady Matham*, *Marchioness of Bute*, *Apollo*, *Gloriosa*, *Kaiserin*, *Matchless*, *Duchess of York*, *Canon Hole*, *Crasley Gem*, *Beauty of Epsford*, *Bertha Mawley*, *Lady Penzance*, and *Sir Roger*; which latter, of the type of *Bertha Mawley*, has a small flower set on a stiff foot stalk, admirably adapted for filling flower-vases. New varieties of the type of *Matchless* are not plentiful, and can be obtained only by a long course of selection running through many years. The fine autumn of 1895, so favourable for crossing and seed production, should afford some advances in the decorative section of Dahlias. *R. M., Newbury.*

**THE PENTSTEMON.**—I saw a very fine strain of *Pentstemon* last summer in the gardens of Barford Lodge, Dring, the residence of Sir Trevor Lawrence, Bart. Mr. Bain was very proud of his bed, and he certainly had much reason to be so. They were, to all appearance, plants which had stood out all the winter, the soil being fairly dry, and the position a somewhat sheltered one. Or the plants might have been grown on from cuttings struck at the end of the previous summer, though I should think, from their size and vigour, they were seedlings. In the middle of July they were in full bloom, and it is no cause for wonder that they attracted a great deal of attention from visitors. The naming of fine varieties of *Pentstemon* is still followed in

Scotland and in France, but seminal varieties from a good strain are now so fine that there is scarcely a necessity for naming. Anyone contemplating raising seedlings would do well to obtain, say, half-a-dozen good named varieties. Secure some seed from these and raise seedlings, and it is certain something very fine will come from them. Seed may be sown in heat in the early part of February, and as the seeds quickly germinate, plants are soon obtained, and these, if pricked off into boxes and kept in warmth until established, and placed in a cold frame in April and May, may be planted out in a well-prepared bed in July. A few of these would probably bloom the same season, and if the plants came through the winter in safety, they would bloom very finely in June and onwards. And not only is the *Pentstemon* free of bloom, but it is also remarkably continuous. The main spike is the first to be lined with blossoms, and in the case of well-grown plants it is long, dense, and striking; and then the side shoots follow suit, thus maintaining a succession. The *Pentstemon* does well in a good sandy loam, provided it is not too moist, as then the plants are apt to suffer from frost, as they certainly did in the heavy, moist, sandy loam at Bedford, which is on the verge of the Thames Valley. Last winter played havoc with many strong plants, the frost being very severe when they were in a soft, green state; so, for this reason, I recommend a fairly dry position in preference to a wet one, and, though drought would probably affect the plants somewhat, they can be kept in vigour by watering them. Propagation of any particular variety of the *Pentstemon* can be done by dividing the roots of a strong plant, though when such divided plants bloom, they are rarely so effective as are seedlings or those obtained by means of cuttings. Cuttings may be made from shoots put up from the roots at the end of the summer, as these do not, as a rule, flower the same season. If placed in pots of well-drained sandy soil, and kept in a cold frame, they make roots, and when potted-off in early spring, soon grow into a good size for planting out. I have got small plants of rooted cuttings from Scotland in May, and with a little attention they have made fine plants by the end of the summer. A good start can be given to rooted cuttings kept through the winter in store-pots, by potting them singly into small pots, and affording them a start in a gentle heat. It is also possible, as a matter of precaution, to lift in the autumn some of the finest seedlings, potting them, wintering them in a cold frame, and then by placing them in gentle heat in the spring, young growths can be secured for making cuttings, which strike freely in a moist heat. In some parts of the country *Pentstemons* are exhibited as cut flowers, though it is only rarely one sees them forming a clump of themselves. But a bunch of spikes of a good variety has a bold and striking effect in a collection of bunches of hardy flowers, and is often found there. The variety employed should be fine in quality, the spike long, and well furnished; the corollas standing out nearly or quite horizontally from the stem as those of some of the milder varieties do—and then a good effect is secured. The *Pentstemon* is deservedly one of the most popular of our hardy perennials. *R. D.*

**BOXES FOR USE ON THE GREAT EASTERN RAILWAY.**—In the *Gardeners' Chronicle* of February 8, p. 165, "D. T. F." speaks very highly of the "cheap" boxes as supplied by the Great Eastern Railway Company for supplying the public with garden produce, &c. Will he be kind enough to say what kind of produce anyone would be likely to send in such frail boxes? I have seen them, and should not like to trust anything very valuable in them. The No. 4 size—length 16½ inches, breadth 11½ inches, depth 5½ inches—are made with the ends half an inch thick, the sides, bottom, and lid, only one-eighth of an inch thick, with bottom and lid in two pieces. This will give most people an idea of the stoniness of these boxes; and they must not be corded, simply nailed down—but anyone, I suppose, may have boxes made stronger, but they must keep to the size; therefore, they would be useless for almost any kind of fruit that required packing. I doubt if they would be even safe enough to send such things as Asparagus. It is no doubt a step in the right direction; but some information from the real growers and packers would prove useful to other companies who may contemplate trying the scheme. *J. H.*

**THE LARCH DISEASE.**—The following from Mr. A. C. Forbes' letter in your issue of February 8,

p. 167, col. c, is somewhat misleading:—"The disease, *per se*, is no more harmful than dozens of other parasitic diseases which we rarely hear mentioned, though common enough. There is probably scarcely a single plantation of Larch in the United Kingdom which does not also contain *Peziza Wilkommii*, the only difference being that where the conditions are favourable to the healthy growth of the trees the disease keeps in the background; where the conditions are unfavourable, the disease spreads rapidly, and gets the upper hand. We have been informed that the disease is unknown in Ireland." You may be surprised to learn that there are some foresters and nurserymen who do not know the real Larch disease when they see it, but I would not have supposed that Mr. A. C. F. was one of these; yet the above passage makes me doubt. There is no timber tree disease in this country which causes such wide-spread and wholesale destruction as the Larch disease (canker), and in that respect it may be compared to the Potato disease among vegetables. That culture and situation cannot prevent the Larch disease, nor greatly modify it, as Mr. A. C. F. suggests, has been proved beyond dispute. I had the very same argument sent me by a well-known nurseryman only the other day, and by return of post referred him to one of the very worst examples of the disease in England in a plantation made from his own nursery under the most favourable conditions possible. The Duke of Athol's woods are referred to by your correspondent. I knew the late forestry factor there well, Mr. John Macgregor, and he told me what he told the Forestry Committee, as given in the Blue-book, that there was hardly a Larch plantation in Scotland of recent planting but was badly diseased; and that Larch was now quite unsafe to plant. Will Mr. A. C. F. name one single disease in timber trees that can compare with the Larch disease for general destructiveness? If there be "dozens," he should surely find one. The Larch disease has often been confounded with several other ailments of the Larch that are not particularly common or destructive, hence such statements as the one quoted above. Veitch's recently published *Manual of the Conifere*, professes to deal with diseases, and of the Larch disease there described he says, "it is quite possible to prevent;" and I strongly suspect this is Mr. A. C. F.'s Larch disease also. But, unfortunately, Veitch's Larch disease is not the true destructive Larch disease at all—pp. 31 and 128. The disease there described is called "Larch rot," which "destroys the heart-wood," and "is generated on the roots of felled trees, whence it spreads to the roots of the living plants." That is not the Larch disease, nor is it a very common complaint, whereas the true disease is everywhere. I had a letter quite recently from a nobleman and extensive planter in Wales, who writes that the real disease is so bad on his estates, and others, as to have practically "paralysed Larch planting;" and if Mr. A. C. F. thinks he can assist him, I can give him his address—I have given it up. As to substitutes for the common Larch, they do not seem to have been earnestly sought for yet. What about the Japanese Larch? The descriptions given of it hitherto are wrong, and no one seems to know anything about it. What about the American Larch—two noble varieties—which do so well on the cold elevated regions of the eastern states and in Canada, and the timber of which is un surpassed? The existence of these trees is practically unknown to our forest-tree raisers, who, nevertheless, continue perseveringly to sow diseased Larch, and try to "stuff" their customers with the tale that the disease is a mere matter of culture and situation, and not at all so general as it is said to be, &c. I have read three communications. The disease is as bad in Ireland as in England. *J. S. W.*

**HARDY RHODODENDRON.**—As evidence of the very mild weather experienced this winter, I noticed, on a visit to Wingerworth Hall, Chesterfield, on February 7, two large bushes of Scarlet Rhododendrons in full bloom, each carrying about three dozen trusses; the flowers were perfectly developed, and formed a remarkable contrast with the surrounding leafless trees. The bushes were planted in the shrubbery, and not more protected than their neighbours. I was informed by Mr. Burke, the head gardener, that he decorated the dinner-table with flowers cut from the same trees in the middle of January this year. *J. Clayton.*

**ARAUCARIA CONES.**—Enclosed you will find a photograph of a cone produced last year (1895) by a fine specimen of *Araucaria imbricata* growing in

the grounds of my sister's house. Wansfell Holme, Windermere. Her gardener, Mr. Rothery, forwarded the cone to me, and informed me that it was one of a pair, and he seems to think that this is the first instance of the *Arancaria* producing female cones in the district. Both cones have been carefully examined for fertile seeds, but none could be found. No doubt this infertility has arisen from the fact that no male catkins were visible on the tree. The tree which bore the cones is a peculiarly distinct-looking variety, as it has extremely broad foliage, and is a very handsome specimen, being about thirty-five years old, and upwards of 65 feet in height. *O. O. Wrigley*. [The production of such cones is not very uncommon in the south. Fine specimens were figured at p. 593, November 22, 1890, vol. viii., and Supplement for same date. En.]

## HORTICULTURAL BUILDINGS.

THE erection of vast areas of glass-houses for horticultural purposes, especially market-garden pursuits, which has taken place during the last few years in many parts of the country, and in the London district particularly, must have caused a large extension in the horticultural timber trade, beside creating an increased demand for glass. We were reminded of this recently by an inspection of the establishment of Mr. W. Duncan Tucker, in the Lawrence Road, Tottenham. A development has apparently taken place in this business almost or quite equal to that which has occurred in that of the market growers, and to which we have frequently called attention. In December, 1894, there appeared a small paragraph in the *Gardeners' Chronicle* to the effect that the business works had suffered from a fire, which practically destroyed them. The business was afterwards carried on upon temporary premises, and no time was allowed to pass before energetic measures were taken to erect new works upon the site of the old ones. These have been completed during the present winter, and in such an efficient manner, than an outsider might be disposed to think a destructive fire was not without its compensations. The following brief notice of the principal details may be interesting. The main building is 150 feet long by 100 feet wide, and along both sides are galleries upon which the doors, &c., are put together, and various light work carried out. By means of a platform at one end, a tour may be made round these galleries, which are lighted from glass doors which run along the extent of the building. The whole area is covered by a capital iron roof which is said to have involved the use of nearly 100 tons of iron. It is splendidly lighted, and as fire-proof as such a place can be made, and the boiler-house has been advisedly kept apart from the building. To drive the machinery, there are two engines of 25 h. p., and these are fed by two Cornish boilers capable of working at 90 lb. pressure. All the shafting is underground, and at one side where the chips of wood fall from the machines, an ingenious arrangement ensures their prompt removal to the point nearest to the boiler-house. There are three distinct entrances to the saw mill, and at the main inlet the transfer of logs to the table is facilitated by an overhead traveller. The newest machines have been obtained, and every possible device for labour-saving adopted. There are immense facilities for storage, and no excuse, therefore, for using unseasoned wood. The visitor may see operations going on in the various stages of the manufacture of doors and window-frames for greenhouses, sash-bars, end and division rafters, end and side plates, pitlights, bottom and top rails, ridges, eilées and seats, and various other "parts," according to the work of the moment. These are chiefly made from pitch Pine, a wood which Mr. Tucker thinks the most suitable for the purpose. The extension of the business has been mainly in the working and supplying of timber for horticultural purposes, and in the erection of glasshouses and conservatories, but a trade is also done with general builders and contractors. Some large nurserymen, such as Mr. Thos. Rochford and others, who have always to keep a certain number of skilled hands upon the place, prefer to erect their houses themselves, and are the

customers for "parts" only. The supply of these to the different firms of Rochford for some years past has been almost a business in itself. Others, and, of course, the majority, purchase the houses completed, and in these cases they are first erected at the works, and then sent in parts to their destination. We were informed that it is intended to yet further develop the branch dealing with the erection of ornamental hot-houses in private gardens, now that the works have been rendered so efficient. The growth of the work may be calculated when it is known that Mr. Tucker, who in 1881 took to the business originated by his grandfather, at first employed but little labour, and that since that time he has frequently had as many as 250 pairs of hands in his service. In estimating the importance of horticulture, its beneficial effects upon allied trades should never be overlooked.

## Obituary.

ROBERT FARQUHAR.—Many of our readers will regret to learn of the death, at Aberdeen, which took place on the 12th inst., at the age of seventy-five

years, of Mr. Robert Farquhar, late head gardener at Fyvie Castle, Aberdeenshire. Mr. Farquhar was a well-known and highly respected man. A native of Aberdeen, he served his apprenticeship as a gardener at Cluny Castle, Aberdeenshire. After serving the usual three years he came back to Aberdeen, and entered Messrs. Roy's nurseries. From this he went to Thainston. His next place was at Woodhill, Aberdeen. He then engaged as chief gardener to Mr. George Forbes of Springhill, whence he went as journeyman to Caenwood in Middlesex, the seat of the Earl of Mansfield. After staying there for some time, Mr. Farquhar returned to Aberdeen, and acted as head gardener to the late Mr. Charles Runcy, Millbank, where he remained five years. His next situation was at Aden, Old Deer, the residence of the late Mr. James Russell. On leaving Aden he went for a second time to Millbank. Subsequently Mr. Farquhar was appointed head gardener at Fyvie Castle, then the property of Mr. William Cosmo Gordon, where he remained continuously for forty-three and a half years, serving under five different proprietors. During that time the number of greenhouses increased from one to twenty. In all matters relating to hor-

ticulture he took a keen interest, and as an exhibitor at shows his name was well and favourably known over a wide district. On account of failing health, he retired from his post at Fyvie Castle, in 1890. Mr. Farquhar had a high opinion of America as a field for young gardeners, and it was his wont to render every assistance in his power to young men desirous of emigrating thither. Three of Mr. Farquhar's sons are now the owners of one of the largest seed businesses in Boston, U.S. An autobiographical notice of Mr. Farquhar appeared in these pages on July 31, 1875, to which we would refer those of our readers who may be interested in the career of a very excellent gardener and estimable man. Our portrait of the deceased depicts him as he appeared at that time.

JOSEPH CHEAL passed away on the 18th inst., in his ninety-sixth year. In October last, when we had occasion to visit the nurseries of Messrs. J. Cheal & Sons, near Crawley (of which the deceased gentleman was founder), we had the pleasure of a few words with this patriarch among nurserymen, who could talk of men and customs in connection with farming and horticulture comparatively unknown to the present generation except as related history. His genial presence had a peculiar fascination, and his manner was intelligent and pleasant. It surprised us greatly to observe that although he had been unable to get about much latterly, many of his senses were still unimpaired, that of hearing being particularly good. Mr. Cheal was a wonderful man at such an age, and during the greater part of a very long life he was an energetic and upright business man, of temperate and industrious habits. The business has long since been controlled by the deceased's two sons.

## SOCIETY.

### EDINBURGH BOTANICAL.

FEBRUARY 13.—A large number of members of this society met at 5, St. Andrew Square, Edinburgh, on the evening of Thursday, the 13th inst., the chair being taken by Dr. W. CRAIG.

MR. R. STEWART MACDOUGALL, B.Sc., exhibited larvae of *Sirex juvenus* (the Pine-wood wasp), also imago and larvae of *Rhagium bifasciatum*, with specimens of timber damaged by them. Mr. Macdougall gave a very interesting account of the life histories of these pests, and the large amount of damage they were capable of doing. An account of Australian and other foreign trees and shrubs, cultivated in Arran in the open air without protection was read by the Rev. David Landsborough. This gentleman, who has from time to time communicated notes upon this subject for many years, mentioned a large number of plants of temperate regions capable of being grown in Arran, pointing out those that had been injured by the severe frosts of 1894 to 1895. In this communication it was stated that the temperature at Lamash during the above years showed on comparison of February 9, a difference of 22° F. from that of Glasgow; while in summer, the temperature in Glasgow rose 3° higher than that at Lamash. *Chamaerops* (*Trachycarpus*) *excelsa*, *Dicksonia antarctica*, *Cyathea dealbata*, *Rhododendron arboreum*, and many others were uninjured by the severe frosts of last winter. *Dicksonia squarrosa*, *Edwardsia grandiflora*, and others were killed, some others losing their leaves, or being more or less injured.

MR. LINDSAY (Curator) gave his report on vegetation in the garden, referring to the remarkably mild weather experienced during January. The meteorological observations carried out at the Royal Botanic Garden by Mr. A. D. Richardson contained the following items:—Barometer at 32°. Highest, 30.985 inches, at 9 A.M. on the 9th; lowest on the 15th, being 28.848 inches; mean, 30.137 inches, or 0.398 inch above the average for January for five preceding years. Thermometer (protected):—Highest, 54.1°, on the 27th; lowest, 22.8°, on the 23rd; mean of the month, 41.3°, being 5.7° above the average for January for five preceding years. Frost occurred on six days.

The highest point registered by the radiation thermometers in the sun was 87.7° on the 28th; lowest on grass, 10.8° on the 23rd. Frost occurred on the grass on thirteen days. Total amount of sunshine recorded for the month was thirty-five hours twenty minutes. Not any was recorded on fourteen days. Rainfall: rain fell on seventeen days. Total rainfall, 0.790 inch, which is 0.497 inch below the average for January for five preceding years. The greatest fall, 0.170 inch, was on the 26th.

MR. R. L. HARROW read the usual notes on plants of interest that flowered during January, and exhibited *Madeoallia Hinckeliana*, *M. leontoglossa*, *Saccolobium bellinum*, *Brassavola grandiflora*, *Tecoma Smithii*, and other plants from the greenhouse of the Royal Botanic Garden.

OUR POULTRY.

By HARRISON WEIR.

(Copyright.)

(Concluded from vol. xxiii., p. 784)

The Dorking may also be crossed with the Malay, especially with those of a light colour, some of which have white or nearly white legs. Generally, the Malay is too long in the leg and coarse in bone, but put with very short-legged Dorkings, several of the chickens will prove to be good table-fowls though others less so, for it must be clearly understood that in all cross-bred fowls there is a great variation, some chickens taking after one parent, and some the other, while a few will represent both. The produce of this cross is fairly hardy, but as a table-fowl it is no gain on the Dorking.

A useful and handsome fowl may be got by crossing the golden or silver Wyandotti with the Dorking. In this case it is best to use a cock of the former with a hen of the latter breed, the cock one year and the hen two years old. Of course, the bones are larger and the offal more than in the Dorking pure and simple, but generally the chicks are hardy, rich coloured, with white legs and feet, and they mostly have five toes. I prefer this cross to that with a B.rahm, being of a finer quality of flesh, and generally a fuller breast, with a thinner skin, and they come to maturity somewhat sooner than the Dorking. This cross lays tinted eggs.

Next, the well-known Bramah cross is worth attention, from the fact that they are often ready for the fattening-pen earlier than the last, and are found suitable for market purposes in consequence. Many of the "so called" Sussex and Surrey fowls are bred in this way. They are large in bone, and though fattening quickly, still there is much waste in the way of internal fat and large abdomen. They generally have white legs and feet, and the bones are not so fine as those of the Dorking. Bramah hens and Dorking cocks are mostly used.

Also in some districts many of the small farmers keep a rough kind of buff Cochins, square and with very short legs, to cross with a Dorking cock. There are two reasons for this: one is, that the Cochins lay all the winter months a saleable richly-coloured egg, and, as a rule, wants to sit early in the year, thus producing early chickens, which, for market purposes, is by far the most profitable; and another point in their favour is, the chickens are hardy, and the hens good mothers. They fatten readily, though mostly deficient in breast meat, while the legs are large and coarse, and there is much inside fat. Many of the Heathfield, Waldron, and Uckfield "crammed" market fowls are of this kind. I am certain that when the public understand what a really good table-fowl is, there will be "no sale" for such as these. A far better cross as regards firmness of flesh and proportionate shape, may be got by using an old English white-legged game-cock instead of the Dorking. This cross produces a handsome bright coloured bird, and an early one, though not so good in breast-meat as the pure Dorking.

Some market poultry-breeders prefer white Cochins to the buff, being of opinion that they are thinner-skinned, and thus present a better appearance; but the difference in this respect is very little. The chickens of the Dorking and Cochins cross do not feather very readily, but those crossed with the old English game are the quickest and more hardy.

Again, where coloured eggs are in request, the pure Langshan hens are kept, being very excellent winter layers, now surpassing the Cochins, and the eggs often being of a rich mahogany colour, varying to a pinkish buff. With these, the coarse long-legged varieties should be strictly avoided, as they are not nearly so profitable, fertile, or of such early maturity as those with medium or short legs. I much prefer what is termed the "Cobby" square-made birds, and those of Miss Croad, of Poling, Arundel, to any, being of the pure breed from imported birds; and it is of great importance in "a cross-breed" that both parents should be "pure-bred," otherwise, your chickens may come of many shapes and colours. With these Croad

Langshans I have crossed the old English game-cock with much success as table-birds, thus getting the dark-shelled eggs with the fine white-meat breast of the Langshan, and the excellent proportions and qualities of the game in the chicken. I have a couple of pullets of this cross now; they are not large, but very plump and good, though not quite white legs. One cockerel bred this way has white legs. I do not believe in the long-legged, storky Langshans, as patronised by the Langshan Club, and have withdrawn from being a honorary member of it, as I cannot uphold such as representing the useful, well-made Langshans, imported by Miss Croad and others, but either cross-breeds, or wrongful selections.

The Langshan crossed with the so-called Indian game, makes a good table-fowl, but the breast-meat is dryer, and shorter in texture than that of the old English game-cross, this latter "finishing" better, not having so much inward fat and offal. But as an all-round, dark-legged, brown-egg layer, with good white flesh, there is none that I know of to beat the pure Croad Langshan, as got direct from the importer.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following—  
 0, Scotland, N.; 1, Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.; 6, Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S. \* Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending February 15, is furnished from the Meteorological Office:—

"The weather was fine and dry over the Kingdom as a whole, but some fog or haze was experienced at times. In the extreme north and north-west of Scotland, however, rain was rather frequent, and at times heavy. Thunder and lightning occurred at Gilerux (near Maryport) on the 10th.

"The temperature was much above the mean, the excess ranging from 3° in the Channel Islands and Ireland, S., to 7° in 'Scotland, N. and W. and in England, N.W.,' and to 8° in 'Scotland, E.' The highest of the maxima were recorded either on the 11th or 12th, when they ranged from 59° in the Channel Islands and England, S.W., to 58° in 'England, S., Scotland, W., and Ireland, S.,' to 54° in 'England, N.W.' The lowest of the minima were registered on rather irregular

dates, and varied from 27° in the Midland Counties and England, S.W., to 34° in 'Scotland, E. and the Channel Islands,' and to 37° in 'England, N.E.'

"The rainfall was considerably more than the mean in 'Scotland, N.,' but, much less in all other districts. Over the greater part of 'England and Ireland' the fall was scarcely appreciable, but, at many stations measurable quantities of water were deposited in the gauge by the humid fog which prevailed at intervals.

"The bright sunshine was more prevalent generally than during the preceding week, but, was as a whole, below the mean value. The percentage of the possible duration ranged from only 4 in 'Scotland, N.,' 10 in 'England, N.E.,' and 12 in 'Ireland, N.,' to 29 in 'England, E.,' 34 in 'Ireland, S.,' and 51 in the Channel Islands."

MARKETS.

COVENT GARDEN, FEBRUARY 20.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

OLD POTATOES.

Market exceedingly dull, and, except for best samples, the nett prices obtainable are about feeding value. Many farmers have been feeding their stock with inferior samples for some time past. The prospects for the future point to a bad finish.

NEW POTATOES.

Demand has fallen off very much since last report; second-class samples are difficult to move at 12s. to 11s. per cwt.; best samples move slowly at 18s. J. B. Thomas.

## SEEDS.

LONDON: Feb. 19.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report a broadening out inquiry for farm seeds. Quotations all round stand at the unusually low level characteristic of the present early and remarkable season. Turn, both spring and winter, meet an improving sale. The new Wisconsin Green Peas, being cheap, handsome, and excellent boilers, experience increasing favour. Bird-seeds show no quotable change. Rape seed is firm. Mustard unaltered. The imports into the United Kingdom of Clover and Grass seeds for the past month show a surprising falling off from those of January, 1895, amounting in weight to 82 per cent., and in value to 52 per cent.

## FRUITS AND VEGETABLES.

BOROUGH: Feb. 18.—Quotations:—Savoy, 3s. to 5s. per tally; Sprouts, 2s. to 2s. 6d. per bushel; Onions, 2s. 9d. to 3s. 6d. per bag; Carrots, 2s. to 2s. 6d.; Turnips, 1s. 9d. to 2s. 3d. per dozen bunches; Apples, 4s. to 6s. per bushel.

SPITALFIELDS, Feb. 18.—Quotations:—Carrots, best, 30s.; Horse Carrots, 18s. per ton; Turnips, 25s. do.; Onions, 2s. 6d. to 3s. 6d. per bag; Beetroot, 1s. per bushel; Savoy, 2s. to 3s. per tally; Celery, 1s. to 1s. 6d. per bundle; Bunch Greens, 1s. 9d. to 2s. per dozen bunches; Leeks, 1s. per dozen; Turnip-tops, 1s. 6d. to 2s. per bag; Broccoli, 1s. to 1s. 6d. per score; Sprouts, 1s. 6d. per bushel; Parsley, 2d. per bundle; Apples, 6s. to 7s. per bushel; do., cookers, 4s. 6d. to 5s. do.

STRATFORD: Feb. 14.—Trade is slightly better, but the demand is still weak. Quotations:—Collards, 1s. to 2s. 6d. per tally; Savoy, 2s. to 5s. do.; Greens, 3d. to 1s. 3d. per bag; do., 1s. to 1s. 6d. per dozen bunches; Cauliflowers, 1s. to 2s. per dozen; do., 3s. 6d. to 6s. 6d. per tally; Carrots (household), 22s. 6d. to 30s. per ton; do., cattle feeding, 15s. to 22s. do.; Parsnips, 6d. to 9d. per score; Mangels, 12s. 6d. to 16s. per ton; Swedes, 14s. to 20s. do.; Onions, English, 24s. to 30s. per ton; do., Dutch, 2s. 6d. to 3s. per bag; do. Bordeaux port, 4s. 6d. to 5s. 6d. per case; Apples, English cookers, 2s. to 5s. per bushel; do., dessert, 2s. to 4s. 6d. do.; do., Nova Scotian, 14s. to 21s. per barrel; Scotch Kale, 6d. to 9d. per bushel; Beetroot, 4d. to 8d. per dozen; Horseradish, 1s. to 1s. 3d. per bundle; Parsley, 1s. to 1s. 6d. per dozen bunches; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; 2s. to 2s. 6d. per bushel; Rhubarb, forced, 1s. 3d. to 1s. 9d. per dozen bunches; Celery, 5d. to 1s. 3d. per roll; white Turnips, 1s. 3d. to 2s. per doz. bunches, 25s. to 40s. per ton.

FARRINGTON: Feb. 20.—Quotations:—Savoy, 3s. 6d. per tally; Greens, 6d. per bushel; Seakale, 1s. per punnet; Kale, 6d. per bushel; Leeks, 1s. per dozen; Cauliflowers, good, 1s. 6d. do.; Parsley, 2d. bunch; Turnips, 2s. per dozen; Carrots, 2s. 6d. per dozen bunches; Apples, Russets, 20s. per barrel; Baldwins (sound), 14s. do.; Northern Spies, 12s. to 14s. do.; Californian Newtown, 11s. per case; Tomatoes, 1s. 6d. per box; Cucumbers, 12s. per dozen; French Peas, 2s. 3d. per basket of 8 to 10 lb.; Mushrooms, 6s. per half-bushel.

## POTATOS.

BOROUGH: Feb. 18.—Quotations ranging from 35s. to 80s. per ton.

SPITALFIELDS: Feb. 18.—Quotations:—Best Main Crop, 60s. to 70s.; Snowdrops, 60s. to 70s.; Highland Magnums, 60s. to 55s.; Blacklands, 35s. to 45s. per ton.

STRATFORD, Feb. 18.—Quotations:—Dark-soil Braces, 30s. to 35s.; do., light, 30s. to 55s.; Reading Giants, 35s. to 55s.; Sutton's Abundance, 40s. to 60s.; Scotch Main Crop, 70s. to 80s.; Magnums, 60s. to 55s. per ton.

LONDON MARKET AVERAGES: February 19.—Saxons, 70s. to 80s.; Dunbar Main Crop, 70s. to 90s.; do., Braces, 60s. to 80s.; Hebrons, 70s. to 80s.; Sutton's Abundance, 40s. to 80s.; Maincrop, 40s. to 60s.; Imperators, 30s. to 35s.; Magnums, 35s. to 40s. per ton.

## HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 65s. to 90s.; inferior, 45s. to 63s.; hay, best, 60s. to 85s.; inferior, 35s. to 60s.; mixture, 63s. to 85s.; and straw, 20s. to 40s. per load.

## VARIORUM.

**BIG TREES.**—PORT MORESBY (New Guinea).—All the old records regarding the height of the tallest trees in Victoria are now discarded. Mr. G. S. Perrin, Inspector of Forests, kindly supplies answers as follow to your queries:—"I. Trees up to 300 feet are fairly numerous at Yea River, Dandenong State Forest, Cape Otway, Mount Baw-Baw, and other parts of Gippsland. When Commissioner of Forests in Tasmania, I measured a fallen Blue-gum at Greenstone, on the Huon River—result, 330 feet. This is actually the highest tree which

has yet come under my personal observation, either in Tasmania or Victoria. Trees have been reported up to 470 feet, but the measurements cannot be now verified, and it is doubtful if any tree in Victoria can be found by theodolite measurement to exceed the height of the Tasmanian Blue-gum given above. The celebrated tree, 'The Baron,' discovered by Mr. Boyle some thirty-five years ago, and afterwards photographed by Mr. W. J. Caire, was stated by these two men as being 470 feet high, and Baron Sir F. von Mueller has made mention of this tree in *Eucalyptographia* as being the height stated. Some four years ago I organised a search party, and with Mr. Boyle and Mr. Fuller, then engineer of the Melbourne Water Supply Department, the tree known as 'The Baron' was re-discovered, and a correct survey was made by theodolite, with the result that the true height was found to be only 219 feet. The photographs of this and several other trees were taken after a theodolite survey had been effected. The highest tree discovered on this occasion was on the Sassafras Creek, Dandenong State Forest, not far from The Baron; its height was 258 feet. 2. Trees up to 90 feet girth at Cape Otway beach forest are known, but are not common. I do not know of any tree 100 feet in girth in Victoria. A tree at the Castra, in Tasmania, is recorded upon the survey maps of the district as 66 feet at 6 feet from the ground. Girth measurements are always unsatisfactory, as they generally include buttresses, &c." *Australian Paper.*

**BACK WALL IN COOL-HOUSE FACING SOUTH:** X, Y, Z. Instead of Ferns, the pockets might be filled during the summer with various Begonia, flowering and foliage; *Roches falcata*, *Cactus truncatus*, species of evergreen *Sedum*, as *S. hybridum*, *S. spathulifolium*, *S. umbilicoides*, *S. Sieboldii*, with broad leaves; and *S. amplexicaule*, *S. stenopetalum*, *S. pulchellum*, &c., with terete leaves; *Saxifraga sarmentosa*, *Opuntia*, *Ixia*, *Tritonia*, *Bahiana*, *Indian Strawberry*, small-growing *Ivy*, *Rubus roseifolius*, and *R. r. coronarius*, and *Stapelia* in variety. A few climbing plants might be introduced, as *Plumbago capensis*, *Bignonia jasminoides*, some of the robust growing scarlet-flowered *Pelargonium*, *Ivy-leaved Pelargonium*, *Polygala Dalmaniana*, *Orange and Lemon plants*, &c., *Jasminum grandiflorum*. The bed in the front of the wall might be covered with Derbyshire spar to serve as a place for exhibiting plants in pots at all seasons. *Chamaerops humilis* and *C. excelsa* might be planted in brick receptacles made underground; the hardy species of *Bambusa* would also succeed in this manner.

**BUTTERFLY:** *J. W.* The common tortoise-shell butterfly, *Vanessa urticae*. The insect had probably been dormant all through the winter. Cases are recorded of this butterfly remaining in a dormant condition for nine months.

**CARNATION DISEASED:** *J. H. C.* The plant has been attacked by the fungus *Helminthosporium echinolatum*; see figure and description in *Gardeners' Chronicle*, August 21, 1886. Cut off and burn all affected leaves, also destroy badly-affected plants in the same way, there being no known cure.

**CORRECTION: BEGONIA OBTUSI.**—Mr. Herrin informs us that the plant described by "R. D." in our last issue under above name is really *Oxalis Ortigii*.

**DOUBLE-SPATHED ARUM:** *J. M.* Not uncommon, though no one seems to try and fix it. This would be a desirable thing if all were as fine as yours. Thank you for the photograph of the *Dendrobium*, a very nice specimen, but as you say, often illustrated.

**HOT-WATER PIPES:** *F. K.* Before starting the forcing-house, the paint on the pipes must be washed off. A very strong solution of soda and water, used hot, will do this. Lamp-black and lincseed-oil, without driers or turpentine, makes a good coating for hot-water pipes.

**INSECTS:** *S. G. S.* The "worms" sent are the grubs of a Click-beetle—*Elater sputator*—rightly, "wire-worms." There are four species of *Elater*, and all injurious to the roots of plants. The grubs remain in this wire-worm state for four or five years. You might try soot and lime-water, but we can give you little hope of ridding the potatoes of the pest. Guano and superphosphate might also be tried.—*Echeveria*. The larva of a weevil. You will not be able to turn them out of the soil by anything that you may apply which will not kill the plants. You should, therefore, turn out the plants, and examine the soil carefully for the grubs, destroying them when found. Get potting-soil from a pure source.

**LIBONIA:** *T. H.* Your plant is either too young to produce flowers, or it is not sufficiently pot-bound.

**NAMES OF PLANTS:** *S. H.* 1, send when in flower; 2, *Lycostera formosa*; 3, *Photinia serrulata*.—*C. L.* Your *Cymbidium* is *C. eburneum*. It varies in the spotting of purple on the lip when it is present, but often that colour does not appear. *C. Parishii*, which may probably be regarded as a form of the same species, has much broader segments and a different odour.—*A. G. M.* 1, *Masdevallia polysticta*; 2, *Masdevallia melanopus*; 3, *Cymbidium Lowianum*; 4, *Dendrobium Pierardii*.—*C. R. D., Newbury.* 1. It would scarcely be *Cattleya Mossae* flowering at this season. Is it not *C. Trianaei*? It should be potted later in the season when rooting well. 2. If the *Dendrobium* are "bursting" all the way up the pseudo-bulbs, it should be with flowers. If the buds prove to be growths the plants are in an undesirable condition, unless desired to make young plants. You had better start your plants into growth as soon as they are seen to be pushing. 3. An Orchid may be presumed to have finished its growth when all the last-made leaves are fully formed, and no more appear. The deciduous species give further proof by the leaves withering.

**NOTICE TO QUIT SERVICE:** *Fairplay.* If you are not residing on the premises, and have no other additions to your pay than the bonus at the end of each month, the employer possesses the right to give you a week's notice. He is not likely to strain a point in your favour after you have opened a shop in his neighbourhood.

**WHERE TO START A FRUIT AND FLOWER GROWING BUSINESS IN YORKSHIRE:** *H. J. G.* Near a large manufacturing town, or at Scarborough or Whitby.

**WOOD ASHES:** *A. M.* If you cannot get such a common thing as this in the country, application might be made to a dealer in horticultural sundries. Scan our advertisement columns.

**YEW HEDGE:** *Bonham Carter.* You have gone the right way to work with the hedge, so as to get it thickened at the bottom. The severe pruning of the top will have caused the death of a great many small roots, and thus a sort of rough balance between top and roots has been formed, and it is questionable whether any other sort of root pruning is required in this case; shovelling away the exhausted upper layer of soil, substituting for it some good loam and leaf-mould, and a mulch of farmyard manure would be beneficial, as would also a few thorough waterings between the present time and the beginning of June. The hedge should be clipped with the shears in the spring, and again early in August.

**COMMUNICATIONS RECEIVED.**—G. H. Hunt.—A. V.—W. E. G.—D. R. W.—T. B.—J. T.—Dr. Zacharias, Hamburg.—M. T.—A. C. F.—P. W. Woolley.—E. C.—J. B.—W. E. R.—J. F. McLeod.—Attwood, Bristed & Co.—J. D.—G. ## MESSRS. BELL'S BOTANICAL BOOKS.

### JOHNSON'S GARDENERS' DICTIONARY.

New Edition, thoroughly Revised and  
Considerably Enlarged by

**G. H. WRIGHT, F.R.M.S., & D. DEWAR,**  
*Curator of the Glasgow Botanic Gardens.*

Complete in One Volume, Demy 8vo,  
cloth, 9s. nett.

NOTE.—The First Edition of this work was published in 1846, and at once became recognized as the standard authority on the subject, a position which it has retained ever since. It has passed through numerous editions, but has not been completely revised since 1863, though Supplements have twice been added since that date. For this edition the whole book has been carefully revised from beginning to end, with considerable additions, and has in all respects been brought up to the present state of Horticultural knowledge.

"It is without doubt one of the most reliable and important Gardening Dictionaries that has ever been published; in fact, as a dictionary and guide for gardeners, amateur or professional, its equal is not to be found in Horticultural literature. When the eight parts are completed, it will form a marvellous digest of matters horticultural, and a standard work for the guidance of all interested in the art and science of gardening."  
—*Horticultural Times.*

## SOWERBY'S ENGLISH BOTANY.

Containing a Description and Life-size Drawing of every British Plant. Edited and brought up to the present standard of Scientific Knowledge by T. BOSWELL (late SYME), LL.D., F.L.S., &c. Third Edition entirely revised. With Descriptions of all the species by the Editor, assisted by N. E. BROWN, Twelve Vols. with 1937 Coloured Plates. £24 3s. in cloth; £27 15s. in half-morocco; £31 13s. in whole morocco. Also in 89 Parts, 5s. except Part 89, containing an Index to the whole Work, 7s. 6d.

SUPPLEMENTARY VOLUME. To be completed in 8 or 9 Parts. Parts I.—III., by N. E. BROWN, of the Royal Herbarium, Kew, forming Vol. XII. of the complete work. Cloth, 17s.; or the Parts separately, 5s. each.

## FUNGUS-FLORA,

A Classified Text-book of Mycology. By GEORGE MASSEE. Author of *The Plant World*. With numerous Illustrations. The most complete work on the Fungi. 4 vols. Post 8vo, 7s. 6d. each.

If set across three Columns the lowest charge will be 30s.

Page, 2s.; Half Page, 2s. 10s.; Column, 2s.

### GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,  
41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

**BOOTY'S** Wall Fern Tiles (or pockets) for covering vacant walls with Ferns; a sub-titute for Cork and wire-netting; easily fixed. Numerous testimonials. Price Lists free.—**BOOTY AND CO.**, 15, Bride Lane, Fleet Street, E.C.

# GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH" ROLLING AND COLLECTING MACHINES FOR 1896.

The Winners of every Highest Prize in all cases of competition, and the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.  
HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,  
HIS ROYAL HIGHNESS THE PRINCE OF WALES,  
THE KING OF THE BELGIANS,

The Late EMPEROR OF THE FRENCH THE EMPEROR OF RUSSIA,  
And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.  
most excellent, as is proved by the fact of some of the Horse Lawn Mowers having been in use here for upwards of thirty years; but combined with good workmanship is the further important recommendation that they are of very light and easy draught."

Upwards of 220,000 of these Machines have been Sold since they were first introduced in the year 1856.  
They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.  
The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

### SINGLE-HANDED SILENS MESSOR LAWN MOWER, With Improved Steel Chains, Wheels, and Handles.

To cut 8 in., can be worked by a Lady ... £1 15 0  
To cut 8 in., do. ... 2 10 0  
To cut 10 in., do. by a strong youth 3 10 0  
To cut 12 in., do. by a man ... 4 10 0  
To cut 14 in., do. do. ... 5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

### DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man on even lawn ... £3 10 0  
To cut 18 inches, do. man and boy ... 7 10 0  
To cut 20 inches, do. do. ... 8 0 0  
\* To cut 22 inches, can be worked by two men ... £8 10 0  
\* To cut 24 inches, do. do. ... 9 0 0  
\* If made stronger, suitable for Donkey, 30s. extra.

These Mowers are the "No Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Prices of Donkey, Pony, and Horse Machines, including Patent Self Delivery Box, or Side-delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

### DONKEY AND PONY MACHINES.

To cut 26 inches ... £14 0 0  
To cut 28 inches ... 15 0 0  
To cut 30 inches ... 18 0 0  
Leather Boots for Donkey ... 1 0 0  
Leather Boots for Pony ... 1 4 0

### HORSE MACHINES.

To cut 30 inches ... £22 0 0  
To cut 36 inches ... 26 0 0  
To cut 42 inches ... 30 0 0  
To cut 48 inches ... 34 0 0  
Leather Boots for Horse ... 1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

### GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

HIGHLY RECOMMENDED FOR SMALL LAWNS.

PRICES, With Grassbox.  
To cut 8 in. £1 5 0

**G. H. RICHARDS, Sole Manufacturer,**  
Old Shot Tower Wharf, Lambeth, London, S.E.  
TRADE SUPPLIED ON BEST TERMS.

THE MOST SUITABLE FOR SHADING ORCHIDS, FERNS, Palma, and Stove and GREENHOUSE PLANTS.

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.

It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchid and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used.

Blinds made up and fixed complete. Sold in pieces, 30 yards long by 1½ yard wide. Price 40s. each. Samples submitted gratis.

## MACHINES FOR HORSE & PONY USE.

Lord's Cricket Ground,  
London,  
June 15, 1894.

I have used your Lawn Mowers for over twenty years, and have no fault to find with them. I consider them the best in the market, and they are the only Machines we use here. The addition of the *springs* to our 48-inch Mower is a great improvement, and the Machine works with great ease and smoothness. I consider you have made a good hit:

Yours truly,  
(Signed) PERCY PEARCE,  
Ground Supt.

Horse Lawn Mower,  
FITTED WITH PATENT AXLE SPRINGS.

# THE GREAT DISEASE-RESISTING POTATO.

## The Sutton Flourball.

### A NEW MAINCROP VARIETY.

Twenty-six years ago we introduced our Red-skin Flourball, the pioneer of "disease-resisting" varieties, and its reputation as a heavy cropper, practically free from disease, is still maintained. We now offer a new red round Potato, which, after severe trials, has proved to be twice as productive as Red-skin, and possesses the advantages of excellent form and superior table quality in early autumn, even after a very wet summer. Most important of all, however, is the fact, that in 1894, a season nearly the worst on record for disease, The Sutton Flourball came through the ordeal unscathed, while Beauty of Hebron, growing by its side, was more than half diseased.

Mr. JOHN KERLEY, The Gardens, Parsonage Manor, reports:—

"Mrs. Hill had 14 lb. of The Sutton Flourball Potato, which I planted on March 4, 1895, and lifted 140 lb. of splendid tubers. I have sent you a sample of the crop, but I have had tubers half as large again as I am sending. Out of the 140 lb. I had not one bad Potato, and only two gallons small. The garden they were grown in lies low, in fact, adjoining a water-meadow, which is naturally low and cold. I am sure it needs only to be more widely known to ensure a great future for The Sutton Flourball. Of the many different varieties I have grown, none excels it as a cropper and table Potato."

Price, per 14 lb., 4/-; per ½-Cwt., 14/-.

## THE Gardeners' Chronicle.

SATURDAY, FEBRUARY 29, 1896.

### PLANTS FOR HOME DECORATION AND EXHIBITION.

NEXT to being able to grow plants to perfection, or somewhere near it, it was considered that the cultivator should be able to arrange them with good effect, so that the various beauties of the plants and the harmonious blending of the colours of the flowers could be seen to advantage. The idea prevails that arrangement is of small importance if only the plants are well-grown specimens.

#### HOUSE DECORATIONS.

It was considered to be a happy state of affairs that we are getting away from, although slowly, the "dotting" methods which were so much in vogue some years ago. In proof of this, attention was called to the kinds of flowers made use of for table decoration, where we now only use flowers of one or two species in a decoration at any one time, in former years we found the miscellaneous dotting or mixed fashion in general use. With the present fashion there may be a change in the colour of the flowers and in the species of plants employed every time fresh plants or flowers are required for the decoration of the dinner-table or drawing-room, thus rendering the work of more interest to, and engaging the attention of those who previously did not pay much heed to the matter, as well as causing a person to marvel at the many varied and pleasing effects which can be produced by skilful management of the colour of the flowers, the arrangement of the plants, and of the striking and handsome foliage. On the other hand, with the mixed system, much the same colours must prevail each time fresh flowers are supplied—consequently, there is less to interest the spectator.

It was then thought that if the system of massing could be adopted with cut flowers, it might be also applied to plants. It was considered to be to the gardener's own interest as well as credit that he should make the best use he was able of the plants after they had grown to a decorative size. It was pointed out that for some time past the method has been adopted at Falkland Park of growing the young plants in hatches, i.e., keeping all the young plants of one species as far as possible together. By this means they were able to supply each group with that special kind of treatment which is found to be beneficial. The point to which special consideration was directed at this step was, whether from the first the plants which he grows for decorative purposes are made the best possible use of by the gardener? In Mr.

\* The substance of a lecture given on February 6, 1896, before the Chiswick Gardeners' Association, by Mr. A. Wright, Gardener, Falkland Park, Norwood.

WEBB'S, WORDSLEY, STOURBRIDGE.

Wright's estimation, the arrangement of plants in our greenhouses and conservatories is, as a rule, lacking in naturalness. This was accounted for by the necessary artificial arrangement of the interior of such structures; and, consequently, we find the gardener, in too many cases, keeps to the artificial lines already laid down. This was pointed out as a mistake, and the opinion expressed that the sooner the gardener gets rid of the idea that because the house is arranged in straight lines, or is symmetrical in outline, his plants must follow the same arrangement, the sooner will he learn to make a more natural, and, at the same time, a more effective arrangement of the subjects he employs. No valid reason, it was pointed out, could be adduced for the practice that, because we have two corners in the house, we should have a Palm placed in each corner exactly alike; or because there may happen to be four prominent points in the house, we should have four *Dracænas* placed there, or four of any other kind of plant. To the younger members of the association, it was thought that such a doctrine would not accord with their ideas, but with experience and hints obtained by observing the effects produced by different arrangements, these ideas might be modified. If then, we have been wrong in our system of arranging plants, that system has been, and is to a large extent at the present time what he would call the "dotting" system, which is merely the arrangement of plants as and where their size would allow them to be used, and so that they would be a little less in height than the plants behind them. Because a plant was tall it must go in the back row—on the same principle that a large *Chrysanthemum* flower is placed in the back row of an exhibition-board!

#### OUTDOOR DECORATION.

Here, also, Mr. Wright's ruling idea was to copy Nature in her simplicity, rather than despise her teachings. A complicated and laboured effect in an arrangement of plants may be admired for the amount of skill and labour brought to bear upon it, but there is no spontaneous expression of an idea in it, and it therefore fails to please. Here, it was thought, is one of the many advantages possessed by our hardy herbaceous and alpine plants when compared with their less hardy competitors used for the summer embellishment of the garden. In the one case, we find continual change, beauty, and observe pretty effects taking place continually; in the other, the same effect day after day, except it may be, a day after heavy rains, when there is scarcely any effect at all!

Mr. Wright's listeners were, however, asked not to forget, that to be successful, we must group our hardy plants (as well as those inside) in large enough masses to make them effective—much, of course, depending on the size of the garden at command. For instance, a small clump may be effective in a small garden, whereas it would be lost in one of larger size.

It was remarked that we are grouping our hardy plants more and more every year, but we must further extend this grouping, so that we may have several successive crops of flowers from the same space during one year, and that without having to replant more than once a year, or it may be once in two or three years. With such an arrangement of grouping, hardy plants become more interesting, because of the continuation of masses either of flowers or beautiful foliage for a long period. Fashion, it was stated, is continually changing in gardens, as well as in almost everything else, but it may be, that after

all, we are only endeavouring to find out a more perfect ideal than has heretofore existed, and that the grand ideal of the garden has not yet been realised, although we are at the same time drifting towards a more perfect conception. Those, said the lecturer, who are old enough to look back on the different changes that have taken place in a lifetime in gardening, can easily note where such changes have taken place, and where many improvements have been carried out in the formation of different gardens.

of plants. Season after season we see almost the same specimens carrying off the prizes. It may be, there are one or two fresh ones amongst the half-dozen specimens, but to the ordinary observer the plants are the same; and they may have been "preserved in spirits" since the last show for anything the general public may know to the contrary! The consequence is, that flower shows are not so largely patronised as in past years. Again, it was remarked that, after a visitor has seen one large

FIG. 36.—*MASDEVALLIA* X *SHUTTAYANA*, CHAMBERLAIN'S VARIETY. (SEE P. 263.)

Colour rosy mauve, with reddish-purple markings; tails yellow.

#### EXHIBITIONS.

Mr. Wright observed, that whatever system of grouping we may adopt at home, when we come to an exhibition our best endeavours are put forward—we try to excel everything that we have previously done. Here we find also that we must not attempt the same system of arrangement too often, for the public as well as the judges are always looking for something novel and fresh. One point struck the lecturer as remarkable, this being the length of time the classes usually met with in flower-show schedules have found favour with the public, in which prizes are offered year after year for a certain number

show of the season—say, in the neighbourhood of London—if he goes to another he finds the same plants in the leading classes; and so, as a matter of fact, the show has little to interest him. To remedy this defect, the lecturer would apply the system of grouping to all our horticultural exhibitions, thus introducing something of interest all round, both to the gardener and the general public. To some persons it might seem sacrilege to hint at discarding those "specimens" that go to make up most of our horticultural displays, but all the same they have had their day. Fashion here, again, is changing in the taste of the plant-loving

public. At one sweep, without the least compunction, he would do away with all those classes in flower-show schedules that limit the number of plants in a class, and give instead a certain number of square feet wherein the plants of that class should be arranged. We are, it was stated, to a certain extent following this line in our groups of stove and greenhouse plants arranged for effect, and so far those "groups," are, on the whole, successful. But let us extend this system, and instead of having a class for "six exotic Ferns," say, "For the best group of Ferns, arranged for effect in a space not exceeding 40, 50, 60, or 100 square feet," or whatever number of square feet may be desirable.

When we come to foliage plants, such as Codieums, Begonias, Caladiums, Palms, &c., a groundwork of some other plant should be allowed. Where it is known that a certain plant makes a better groundwork for a particular class, that plant should be mentioned.

Mr. Wright had no hesitation in saying that a show carried out somewhat on these lines would be far more attractive than our flower shows are at the present time. We should then expect to see something fresh, and different, wherever we went. Another important feature pointed out was, that such an arrangement would allow many more exhibitors to enter the lists than at present; besides the far greater number of beautiful plants it would bring before the public, which at the present time, although far prettier, are left at home because not large enough to compete with their larger brethren.

## NEW OR NOTEWORTHY PLANTS.

### ODONTOGLOSSUM × WILCKEANUM,

*Pitt's Variety.*

OF late but few really remarkable forms of *Odontoglossum* × *Wilckeanum* have appeared, and the advent of one with some peculiarly distinct and desirable features at Messrs. Protheroe and Morris' Auction-rooms on Friday, February 14, caused quite a revival of the old enthusiasm among lovers of *Odontoglossum*. No better evidence of the fact can be adduced than the intelligence that after a spirited competition it became the property of H. T. Pitt, Esq., of Roselyn, Stamford Hill (gr., Mr. Aldous), at the substantial price of seventy-four guineas; the plant was but a small one, and its owner is confident that he can succeed in growing it into far greater beauty even than it now shows, and for the purposes of identification he wishes it to be called Pitt's variety.

The flowers as at present seen are not of more than average size, but they display themselves better, and are of firmer substance than most others of the class. The colour and the disposal of the blotches on the segments make the chief difference, and in these respects it may be, comparatively speaking, called a brilliant flower. The ground colour is a bright very light yellow, fading off to cream-white towards the margin. The sepals have two-thirds of their surface covered by three large brownish-red (almost blood-red) blotches. The petals have numerous smaller blotches of the same colour, and the lip bears one large blotch in the centre, and a smaller one on each side of the yellow crest. In the arrangement of the blotches, and in some other respects, this beautiful variety calls to mind a very large *O. × elegans*, but its crest and lip are those of *O. × Wilckeanum*. *James O'Brien.*

MASDEVALLIA × SHUTTLEWORTHIANA, CHAMBERLAIN'S VAR. (SHUTTLEWORTH'S ♂, HARRYANA ♀).

With such a wide range of variety for the cross-breeder to select from as that furnished by the

extremely variable (both in size and colour) forms of that showy species of *Masdevallia coccinea* generally known in gardens as *M. Harryana*, it is no more than might be expected that much variety will be shown in the crosses raised with it, as in the present instance. The plant, thanks to the careful selection of the forms of *M. Harryana* and *M. caudata Shuttleworthii* by Mr. Burberry, gardener to the Right Hon. Joseph Chamberlain, Highbury, takes its place as one of the neatest and prettiest of the large-flowered, dwarf *Masdevallias* (see fig. 36). The flowers are of a clear rosy-mauve, with some reddish-purple markings between the two lateral sepals, and some clear yellow and red lines in the interior of the concave upper sepal. The tails, which are bright yellow in colour, reflex as the flower ages; and the flower lasts about one month in good condition. For the limited space it occupies, few plants could give such a fine show of bloom for so long a time in a cool-house as this pretty cross, and both Mr. Chamberlain (whose first home-raised *Masdevallia* it is) and his clever Orchid-grower are to be congratulated on their *protégé*. It secured an Award of Merit when it was shown before the Orchid Committee of the Royal Horticultural Society on February 11, this year. *J. O'B.*

## A COLLECTING TOUR IN JAMAICA.

(Continued from p. 198.)

OUR road now led us gradually inland towards Bath. We passed very fine trees of Guango, or rain-tree (*Pithecolobium saman*); wild Tamarind (*Pithecolobium filicifolium*), with light fern-like foliage and beautiful scarlet pods; Dogwood (*Pisidia erythrina*), huge Silk-cotton, &c. We also passed thriving plantations of Chocolate and Nutmeg, growing under the shade of Bananas. Here we noticed also numbers of large trees of *Eugenia malaccensis* and *Barringtonia speciosa*. These, and many other trees in the district have spread from the old Botanic Garden at Bath. There is now only a remnant of the old garden, and although only about one acre in extent, it contains fine specimens of *Barringtonia speciosa*, *Spathodea campanulata*, *Pterocarpus Marsipium*, *Lagerstrœmia Flos-reginæ*, *Cinnamomum zeylanicum*, *Myristica fragrans*, *Cola acuminata*, *Baphis aioides*, *Dipteryx alata*, *Inocarpus edulis*, *Omphalea triandra*, *Napoleona imperialis*, *Swartzia grandiflora*, *Oreodoxa oleracea*, *Arcea catechu*, *Raphia Rufia*, *Astrocaryum mexicanum*, *A. vulgare*, *Elæis guineensis*, *Calamus Rotang*, *Corypha umbraculifera*, *Attalea Cohoue*, *Livistona chinensis*, *Caryota sabilifera*, *C. nrens*, *Rhapis flabelliformis*, &c. As there were several specimens of many of these trees, besides smaller-growing trees, shrubs, and climbers, it is easy to imagine what a crowded state the small garden was in. It was simply a jungle till about two years ago, when a good deal of necessary thinning and pruning were done; duplicate or triplicate specimens were removed to give more light, air, and root-space to those allowed to remain; the trees and plants were labelled with neat enamelled-iron labels. The place was put in good order, benches provided, walks laid out (the old walks had become obliterated), and something like order restored. Beyond keeping the place tidy, it is not possible to do much more. The soil is so full of the roots of large trees, and the shade is so dense, that the smaller kinds of ornamental plants can hardly exist. Bath is an ideal place for a tropical botanic garden—a warm, humid atmosphere, frequent showers, and good soil, but the distance (4½ miles by road) from Kingston, the capital, is against it. The baths, from which the place takes its name, are situated in a gorge about a mile and a half from the town, in a very picturesque spot, in the midst of Tree Ferns and other tropical vegetation, growing in the wildest profusion imaginable. The mineral springs occur in a short space, breaking out from the rocks at different levels, and by their warmth are at once distinguished from the ordinary

water of the gorge. The largest spring issues from the face of a perpendicular rock. A covered reservoir of masonry has been built round its outlet, and a pipe fixed in it carries the water to the bath-house. In wet weather the temperature of the water, as it runs from the rock, was taken at 128° F., and it rises in dry weather to 130° F. A short distance further up the gorge is a spring surrounded with masonry in a similar manner to the main spring. Its temperature was taken at 120° F.

"These waters are sulphuric, and contain a large proportion of hydro-sulphate of lime; they are not purgative, and are beneficial in gout, rheumatism, gravelly complaints, cutaneous affections, and fevers. It is remarkable that a cold spring flows from the same hill-side, near the hot spring, so that cold and hot water are delivered alongside of each other at the baths. Some new buildings have lately been erected for the accommodation of visitors, and the management is creditable." *Handbook of Jamaica.*

We stayed in the neighbourhood of Bath for a couple of days, and made a good and varied collection of herbarium specimens. In the woods at Mansfield, once the residence of Mr. Nathaniel Wilson, who for many years was curator of the Botanic Garden, we were fortunate in securing many novelties. We found a very fine variety of *Oncidium luridum* in flower, the individual blooms were much larger than usual, and instead of the brownish hue, were of a distinct and pleasing tint of rose. We also found *Trichopilia mutica* growing on the limbs of large trees. This is a pretty and interesting little Orchid, not previously recorded for Jamaica, and, so far, it is the only representative of the genus that has been found here. There was an abundance of *Anetium citrifolium*, growing principally on the trunks of the Long-thatch Palm (*Calyptrogyne Swartzii*). The woods here abound with beautiful filmy and other Ferns. There are also magnificent timber-trees in great abundance, notably splendid specimens of *Santamaria* (*Calophyllum Calaba*), with trunks over 100 ft. high, and as straight and symmetrical as the mast of a ship. Here, also, we found large trees of *Priocopaifera*, described by Griebach as rare, and the pods were not seen by him when his description was prepared. The trees were in flower at the time of our visit, and to procure specimens, a monster, over 80 feet high, with a girth measurement of about 20 feet near the base, had to be felled. This tree proved to be hollow for a good way up the trunk. It is known as the "Oil tree" in the Bath district. When tapped at certain seasons of the year, it is said to yield a copious supply of an oleo-resinous, inflammable juice, which was formerly used by the negroes for burning in lamps, but it emits a very disagreeable odour. The nature of the substance requires investigation, and the owner of the property kindly promised to procure a good sample of the "oil" for that purpose.

After leaving Bath, we struck off in a north-westerly direction for the Blue Mountain Coffee region, going up the Plantain Garden River valley. The African Oil Palm (*Elæis guineensis*) is quite naturalised here, and grows luxuriantly in large numbers. The Bread-fruit tree is very common in this valley, and the labourers working on the road in course of construction were gathered in groups when we passed, eating their breakfast, which appeared to consist chiefly of this fruit, either boiled or roasted. The vegetation in this valley, taken on the whole, is very similar to that of the Swift River Valley: *Eugenia Jambos*, *Grias caniflora*, *Pithecolobium latifolium*, *Bamboos*, *Mahoe trees*, *Xanthoxylum*, many *Melastomaceæ*, *Rubiaceæ*, *Compositæ*, *Piperaceæ*, *Laurineæ*, *Euphorbiaceæ*, &c. Along the banks of the river, in open damp places, *Alpinia Allinghas*, an Asiatic plant, is quite naturalised. There are acres of it, with stems growing to a height of 6 or 8 feet.

The track follows the course of the river, now on one side till stopped by immense, almost perpendicular rocks, then crossing, and along the other bank for a short distance, till obstructed by another wall of rock, and so on, crossing and re-crossing twenty-six times in a distance of a few miles.

An excellent driving road is now being made along one bank, avoiding all the fordings. This is a heavy and expensive undertaking: blasting rocks, levelling hill-sides, and filling up depressions, building retaining walls and culverts; but it will open up a magnificent and fertile valley. After leaving this valley we passed through two thriving sugar estates in a high state of cultivation. The temperature here seemed to us to be somewhere in the neighbourhood of hoiling-point. We were glad to get away from it, and lost no time in getting into the delightfully cool air of the grand and beautiful Blue Mountain, amongst the plantations of Coffee and Oranges, the latter laden with delicious fruit.

We accomplished, to us, a highly interesting and instructive tour, and the impressions formed will not readily be effaced from our memories. *W. Harris, Jamaica, December, 1895.*

## ORCHID NOTES AND GLEANINGS.

### DENDROBIUM NOBILE INTERMEDIUM.

CONCURRENTLY with the fine varieties, "elegans" and "pendulum," of the earlier importations of *Dendrobium nobile*, a very fine white variety was known in gardens as "intermedium;" and, although the name does not seem very appropriate, it is worth preserving for the sake of the plant to which it was attached, which has since been called *D. nobile albiflorum*, and by other names. A variety which seems to be identical with the old *D. n. intermedium*, has just flowered with H. Shaw, Esq., Heathfield, Birch Vale, Derbyshire (gr., Mr. J. Cliffe). The flowers of this plant, which are of medium size, are white, the base of the lip having a distinct purplish-crimson blotch in the centre. The highest form of these white *D. nobile* is the *D. n. Schroderianum*, which, on account of its extraordinary size, its rich maroon-purple coloured disc, and superiority in all respects, should always retain its name. *J. O'B.*

### DENDROBIUM WARDIANUM.

Being an admirer of this very popular Orchid, I am always pleased to read notes on its culture. They always interest me. Mr. Hebden's article on p. 241, *Gardeners' Chronicle*, should be read by anyone who is unacquainted with the general points of culture, and yet wishes to grow the plant to perfection. On Feb. 7, I saw a houseful of *D. Wardianum* in bloom at Eaton Hall, Chester. The plants from end to end of the house were beautifully flowered, and they were stood amongst a quantity of *Adiantum capillus-veneris*, furnishing a sight not soon forgotten. See our issue for Jan. 18, p. 71. *Geo. Burrows, Berrwick Gardens, Shrewsbury.*

## THE STANHOPEAS.

The figure of *S. Haseloviana* in the *Bot. Mag.* for January, has again brought to my mind an idea which has been there before: whether or not in the production of these coloured plates, it would not be better to have the flowers photographed in the first place; and if not the flowers because these are to be coloured, certainly the parts of the flower that have not to be coloured, and the drawings of the plant itself, which is sometimes given. In the plate alluded to, are the top of the column, and the pollinia in two positions? I make these comments because I had some excellent photographs from the Rev. F. D. Horner some three or four years ago of *Stanhopea tigrina* flowers, and they certainly were very different from the coloured plates of long ago, and the modern ones do not seem to be any better. Indeed, if we refer to the first plate of *Stanhopea* figured in *Bot. Mag.*, *S. insignis* t. 2948 and 2949, more care seems to have been taken in the year 1829 than in the present year, the pollinia and other parts of the flowers being coloured. In 1834, *S. eburnea* was figured, and evidently the

plants from which the plates have been prepared were splendid examples of culture. It would serve no purpose to specify all the coloured plates, but it is interesting to make comparisons with what was done in the way of culture, and in the preparation of coloured plates then and now, and it really seems that there has been no advance in either in sixty years. Probably we have at least been "marking time."

I have been tempted to write about the *Stanhopeas* because, as a genus, they have been neglected by Orchid-growers. I can well remember, some thirty-five or forty years ago, handsome specimens growing under the shade of Vines, or suspended in baskets from the roof-glass in old hot-houses. Except that the leaves might occasionally be attacked with red-spider, they seldom suffered from insect pests. The flowers, of course, do not last very long in good condition, and the strong perfume

little. *S. oculata* (fig. 37), for instance, was sent to England by the late Mr. G. Ure-Skinner, from Mexico, and from his careful descriptions of atmospheric conditions and temperature, we know at once what to do with it. The temperature in winter falls to 36° to 42° Fahr. It is Guatemalan. In many cases, collectors describe the elevation at which the plants were found, and other particulars. *S. bucephalus* is found at 6000 feet elevation in Ecuador. *S. tigrina* seems to be more widely distributed than most others of the genus, but it is also found at considerable elevations, and cannot require a very high temperature. Mention may also be made of *S. florida* (fig. 33), which possesses handsome flowers. An Orchid that does not require a high temperature will be sure to become infested with parasites in a close hot-house, especially if from a high elevation, as many of the *Stanhopeas* are. They must all be grown in teak baskets with peat and sphagnum. *Jas. Douglas, Ilford.*

## VITIS COIGNETIÆ.

The following account of this plant is taken from *Le Jardin* (p. 195 seq.):—

*Vitis Coignetiae*, Palliat (*V. rugosa*, Ndn., non Vall.; *V. Laurusca japonica*, Thunb.), was found, says M. Planchon, in 1861, growing wild at Hakodate (Yaso Island), by Drs. Albrecht and Maximowicz.

It was not until 1875, fourteen years after its discovery, that this Vine was introduced into cultivation. The credit of its introduction is due to M. et Madame Coignet, who, at that time, were travelling in Japan at the instigation of the Lyons Chambre de Commerce. Madame Coignet admired the plant in its wild state; she collected seed of it which she gave to her father, the late M. Jean Sisley, of Lyons, a well-known horticulturist. M. Sisley sent some to M. Palliat, who raised some plants which he shared with the Ecole Nationale d'Agriculture at Montpellier, as well as with M. Planchon.

At the same time that he forwarded seed to M. Palliat, M. Sisley sent some to M. Naudin, at Antibes. When he examined the plants raised from these, M. Naudin, because of the scuffed appearance of the leaves, and of their rather harsh consistency when touched, called the Vine *V. rugosa*. But this name had previously been given, by Wallich, to another species, and had therefore to be abandoned.

While *V. Coignetiae* was cultivated and studied simultaneously at Lyons by M. Palliat, at the Villa Thuret by M. Naudin, and at Montpellier by M. Planchon, M. Henri Dagnon, Receveur Principal des Postes et Télégraphes, re-discovered it (in June, 1883). Ignorant of its presence in France, he re-introduced it, in January, 1884, from the borders of Ishikari (Yaso Island), whence he sent 1500 plants and a quantity of seeds. The plants were entrusted to the Ecole de Viticulture, at Montpellier, and the seeds, at the suggestion of M. Maxime Cornu, then Inspector-General of Viticulture, were distributed between different French scientific establishments, among others, in addition to the Montpellier school, to the Ecole Nationale d'Horticulture of Versailles, and the Muséum d'Histoire Naturelle, Paris. The seeds sown in 1884, at the museum, yielded a good number of plants.

This remarkable species is characterised by an exceptional vigour, and an amplitude and beauty of foliage quite peculiar. It has also, according to travellers who have observed it in its native country, a very great facility for adapting itself to different climates, to the most varying situations, and a curious aptitude for living under conditions of temperature to which other Vines cannot be acclimatised.

*V. Coignetiae* occurs from 35° N. latitude (in the island of Nippon) to 41° N. latitude (in Yaso Island). One form has been discovered even in the southern part of the island Salchalin, that is to say, towards 46° N. latitude. It is more abundant and more vigorous in places of higher latitude; it is, in fact, essentially a northern species.

FIG. 37.—FLOWER OF STANHOPEA OCVLATA "GUTTULATA."

Colour of the sepals yellow, with a large number of lilac spots; the petals less spotted, the centre yellow, with four blackish-brown spots on the side of the hypochil.

is not agreeable to every one. As a general rule they require, when growing, a high temperature and moist atmosphere, and the leaves to be quite free from thrips and red-spider. However, it is a point in the culture of all species of Orchids that they should be kept clean; and more, they must be grown in a temperature where they have not a tendency to become infested with parasites at all; and now we have three classes of houses, it is easy enough to find the right temperature for all species of Orchids, and it is possible to find a slightly higher and lower temperature in the same house. In our cool Orchid-house, 60 feet in length, there is a difference of 5° between the two ends, with the ventilation the same throughout, and the same remark applies to the other houses.

Referring to *S. Haseloviana*, all we are told of culture is, that "it flowered in the Royal Gardens, Kew, in July, 1894, and perfected its leaves in March, 1895." One does not expect much about culture in a botanical work, but it would have been easy to say it was grown and flowered in the warmest house or intermediate-house, so that any one possessing the plant would know what to do with it. It is stated to be from northern Peru, but that tells us but

It is known that in Europe *V. vinifera* ripens its fruits well up to nearly 50° of N. latitude, and that it can live at some degrees beyond this limit. It is not, then, surprising to see *V. Coignetiae* live and propagate itself in the wild state beyond the 46°, even if the climatic difference is remembered between Europe and Eastern Asia. But there lies some

noted the existence of my Vine from Ishikari. Twenty mètres (65 feet) before reaching the first glacier, I gathered some leaves for my herbarium. When I arrived at the glacier itself I searched (while my companions quenched their thirst with scraps of ice) right and left, and found the same Vine; 100 mètres (300 feet and upwards) above the glacier I saw it again;

prosper in the very cold countries of Europe—provided, no doubt, that it were covered with snow during the time of rest from growth. The foliage is thick, puckered, of a fine dark green, and remarkably fine; some leaves measure as much as 30 cents. (12 inches) in length and the same in width.  
M. Maxime Cornu sent to the *Gardeners' Chronicle*

FIG. 38.—STANHOPEA FLORIDA. (SEE P. 264.)

Flowers white, sepals and petals marked on the inside with purple spots; lip covered with purple spots, having a blotch on each side between the two keels.

interest in the statement made by M. Degron, that as to altitude, it grows even in the glaciers and at the limit of perpetual snows. M. Degron found it, then, in the Island of Nippon, near Mounts Schmidza-Togué and Alcadjisan [these mountains are situated at 36° 30' N.; their altitude is about 1500 m. (5875 feet) above sea-level], although the tracks were reported to be impassable owing to the snow.

M. Degron started for Schmidza-Togué on the 24th; I arrived there on July 28. Everywhere I

finally I met with it about 150 mètres (450 feet) from the summit, on which I tried to climb. . . . I may add that this Vine bears fruit in rather large quantities, the seeds are then as large as Peas, and as round. This peculiarity, so remarkable in a Vine of growing spontaneously, and bearing fruit on the glaciers and up to the limit of the perpetual snows, indicates a quite special temperament; it seems to show that *V. Coignetiae* is hardy under any conditions, and could live and

a notice which appeared in the beginning of 1891 (p. 44), a note, very interesting from the point of view of the history and cultivation of this plant.

According to the descriptions given by the travellers, it is more particularly by the borders of water-courses and in moist places that the plant reaches its full development and greatest beauty.

This species, so remarkable from an ornamental standpoint, is very ill adapted for grafting, even for summer grafting in full sunshine, which with

us succeeds so well with all the more or less troublesome. The particular steps taken to prevent decortication, the use of branches full of strength and dis-budded—none of these precautions yields satisfactory results. Layering only is a safe process; even then rooting is very tardy. This is the principal hindrance to the popularisation of this beautiful species in gardens.

It also resembles certain other Asiatic species, and in particular *V. Romanetti*, and especially *V. amurensis*.

*V. Romanetti* [*V. Romanetti* is often, very wrongly, confused with *Spinovitis Davidii*] differs very markedly by its rigid, glandular, and apparently spiny hairs, which cover the young branches, the petioles and veins, and by the leaves, with deeper and longer divisions.

*V. amurensis*, very similar at first sight to *V. Coignetiae*, and having in common with that species very broad and very thick leaves, differs from it in that these same leaves are less decidedly puckered the lobes are more accentuated shiny on both surfaces; the lower surface, instead of being downy simply has upon the veins (as small), short, and stiff hairs." *L. Henry*.

## BOOK NOTICE.

PETIT GUIDE PRATIQUE DE LA CULTURE DES ORCHIDÉES, par L. Duval. Second edition. (Jardin Office, 167, Boulevard Saint Germain, Paris.)

An excellent little book for beginners and students, stating in clear, unequivocal language the nature and requirements of Orchids, and stating tersely the best methods of fulfilling them. The substance of the book is condensed and to the point; but in order still further to meet the convenience of the amateur, a catalogue of the hardiest Orchids is given, with tabular details as to their requirements. We extract the first entry, in order to show how much information is compressed into a little space. We have altered the arrangement of the table to suit the form and size of our columns. In the original the information is given in parallel columns:—

Name of plant, and brief indication of their floral characters:—*Ada arantia*, flowers vermilion-coloured, in pendulous spikes.

Period of growth: November to April.

Period of rest: May to October.

Period of flowering: February—March.

Native countries: Colombian Andes.

House required: Cool-house.

General observation: To be grown on blocks or in pots.

In other cases the nature of the compost is indicated.

We notice a slip in the native locality of *Cymbidium eburneum*, which is given as *Rummania*.

The illustrations are not of the same general excellence as the text.

## THE WEEK'S WORK.

### THE ORCHID HOUSES.

By W. H. WHITE, *Burford, Dorking*

**MASDEVALLIAS.**—Amongst the species now about to start into growth, is *M. tovarensis*, and the present is a suitable time for repotting or breaking up overgrown specimens of this plant, or such as have become bare of leaves towards the centre. The pots or pans used for *Masdevallias* should be filled up to within 1 inch of the rim with clean crocks, over these a thin layer of sphagnum-moss, the top layer consisting of peat and sphagnum-moss in equal parts, in which the plant will make roots. Water should be very carefully applied after root-disturbance, till the young leaves are well advanced, for too much afforded during this period may cause the old foliage to damp off. The leaves of this species should be cleaned of the small yellow thrips that attack them, with warm water and a sponge. In this mild season the *Odontoglossum*-house will be found a suitable

place for *Masdevallia tovarensis*, but in colder weather it will be prudent to remove it to the coolest part of the intermediate-house.

**SHADING FOR THE HOUSES.**—The sun's rays are now becoming too powerful for some species of Orchids, and in the case of *Aërides*, *Saccolabium*, and *Angraecum* that have been recently re-potted or top-dressed, the need of blinds and shading is apparent when the sun is bright and the sky clear. The inmates of the East Indian-house form another section of Orchids which will require protection from the sun during the brighter hours before and after noon, whereas the *Cattleya* and intermediate-houses will only require shading for an hour on that side of the roof that is exposed to the sun's rays. The Mexican-house, if it be properly attended to as regards ventilation, will need no shading for the present. *Odontoglossum* and *Masdevallia*-houses, especially if span-roofed, and those lean-to houses that have a southern slope, in which sun-heat causes a higher rise in the temperature than is good for these plants, should be shaded. At this season cold winds alternate with bright sunshine, and the air is too harsh to be freely admitted, and in that way keep down the temperature; and this is another reason for the use of shading. With mild moist weather the ventilation may be increased, and shade reduced. At the present time many persons are engaged in experiments with various systems of shading for plant houses. One of the conditions of a good kind of shading is, that it combine sufficient light for the plants without direct sunshine, and to meet this requirement, blinds made of strips of wood, reeds, or split Bamboo canes, fastened together in certain lengths, so as to roll up and down like the ordinary canvas blind, are being advocated. I had hoped that some of my countrymen who have tested this kind of shading in a practical manner would ere this have given the results of their experience to the readers of the *Gardeners' Chronicle*. So far as my experience goes with these blinds, and they have been in use on two houses at Burford Lodge for one season, it is that they allow plenty of diffused light to reach the plants, which is certainly a great advantage for the consolidation of tissues in the leaves and pseudo-bulbs, whilst preventing the sun's rays remaining for any dangerous length of time on any particular plant, so that there is no scorching of the foliage under them. Another great gain is in the equitable degree of warmth maintained in the houses, and this is very noticeable in spring, when the fluctuations out-of-doors are considerable. These blinds, if they are supported about 6 or 8 inches above the glass by means of a light frame-work of iron or wood, tend still more to equality of temperature within the house. The weather last summer afforded a capital test for these open blinds, and the results were satisfactory so far as *Cattleyas* were concerned, the growths becoming more thoroughly matured than formerly, and, as a consequence, they have gone through the useless winter admirably. The same may be said of a small collection of *Dendrobium Poalaëtopis*, *D. tauroium*, *D. superbiens*, *D. bigibbum*, *D. secundum*, and others of that section, which were grown together in one house. These plants have thus far gone through the winter without any spotting of the foliage, or shrivelling of the pseudo-bulbs, although afforded but a very limited quantity of water since they flowered. This seems to show that the tissues were thoroughly matured by the increased amount of sunlight admitted. Until I have had more experience with these blinds I cannot advocate their use on houses containing cool Orchids which stand fully exposed to the mid-day sun, but I may suggest a trial of them on *Odontoglossum*-houses which face north or north-east. As regards *Cattleyas*, *Dendrobiums* generally, Mexican *Laelias*, *Catacactes*, *Cyrtopodiums*, *Schomburgkias* and allied species, I would recommend the use of the lattice blind.

### FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highclere Castle, Newbury*.

**FORMING NEW VINE-BORDERS.**—If it is intended to make new borders, the work should be done as soon as possible, so that the fresh soil may settle before planting-time. If the subsoil be gravel or chalk, no artificial draining will be required. In other cases, provision for this must be made by means of pipes. The main drain or outfall should be placed at the lowest part of the border, and other pipes run from the part where the canes are planted, and discharge into it. Cover the pipes with a good layer of clean brick-rubble or stones, and over this put a layer of turves, with grass-side downwards, and then fill up with the

compost, which may consist of good turfy loam ten parts, lime and mortar-rubbish one part, charcoal and crushed bones half a part each. Well mix this by turning it twice before putting it into the border. In wet, low-lying districts, the border should be kept well above the level, and do not make it too deep in any case, 2 feet 6 inches is quite sufficient. The border should not be made to the full width at first, 4 feet is wide enough for the first year, and a couple of feet may be added annually till the allotted space is filled.

**EARLY CUCUMBERS.**—With bright bursts of sunshine and necessarily freer ventilation, the leaves on Cucumber plants will be apt to flag at times, and this may result in scorching. To prevent such injury it will be well to shade them slightly for an hour or two when the sun is brightest. See that the roots are plentifully supplied with water, and shut up the house early with plenty of surface moisture about. Syringe lightly on bright afternoons only, and the foliage will quickly gain strength and substance sufficient to stand full sun. Stop all lateral growths at the first joint, and thin the fruits freely. It is better to have a moderate early crop than to risk exhausting the plants by too heavy cropping. Do not let the temperature exceed 70° at night, unless the weather be very mild, but a few degrees lower than this in cold weather will not matter. Sow more seed for succession.

**MELONS.**—These should now be making rapid progress, and will need daily attention in regard to stopping and tying. The night temperature should not exceed 70°, with a rise of 10° or 15° in the day-time; more or less air according to the state of the weather. Give no more water at the root than is sufficient to keep them healthy. Sprinkle the paths and surface of the bed each day at closing time, and slightly syringe the plants occasionally when not in bloom or setting their fruits. If grown on dung hot-beds in frames or pits, the glass must be thoroughly well covered at night, and the heat kept up by renewing the linings with fresh hot material as may be required.

**STRAWBERRIES IN POTS.**—When the fruit's commence to colour, a drier and more airy atmosphere should be given them, if possible. This will induce a brighter colour and better flavour in the fruit than a close, moist house. Do not afford manure-water after ripening has commenced. If the plants are wanted for planting out later on, they should be hardened off carefully after the fruit is gathered before placing them outside. If not so required, they should be at once consigned to the rubbish heap. Plants swelling off their fruit should have a night temperature of 65°, and 70° to 75° by day, with a rise of 10° by sun-heat. More attention should now be given to the watering. Examine the plants two or three times a day, and afford such as require it plentiful supplies of weak liquid-manure, with an occasional syringing at closing time to keep red-spider in check. All plants still out-of-doors should be put under cover so as to start them gradually.

### THE FLOWER GARDEN.

By HEDLEY WARREN, *Gardener, Aston Clinton, Tring*.

**MISCELLANEOUS OPERATIONS.**—Continue to propagate bedding plants, and pot off rooted cuttings, and such as require more root space; and keep the stock of *Iresines*, *Verbena*, &c., clean by occasional fumigating. Seedlings of single-flowered *Dahlia*, *Ricinus*, *Z. a.*, *Nicotiana Tabacum*, and *Wigandia* in variety, are best raised early, and seeds may now be sown in gentle heat, the first three as one seed in a small pot, as they will not bear disturbance at the roots. All of the above-named should be grown on in a warm house, being gradually hardened off by the middle or end of the month of May.

**PHLOX DRUMMENDII.**—Seeds of this pretty plant should now be sown, much better plants being obtainable from early sowings, given a cool treatment afterwards, than from late sowings and prolonged cultivation in warmth; a temperature of 50° to 55° is sufficiently high in which to start the seeds, which as soon as they have germinated should be moved to a position, where plenty of air can be afforded; and when the plants are large enough to handle, prick them off into boxes or pans, using a light rich compost; shading and keeping them close for a few days, and as soon as root action has recommenced, ventilating freely.

**TROPÆOLUM SPECIOSUM.**—This beautiful climber is rarely seen doing well in gardens, still it is one of the most effective plants for covering walls

and trellises, or rambling over trees and shrubs, which it will do to a height sometimes of 12 or 14 feet. A north or south aspect is equally suitable for the plant, providing there is no lack of moisture. Propagation is effected by division when the roots are on the move, that is, at this season. When transplanting the pieces afford a liberal supply of rotten manure, and a mulch of some kind. The plant seems to succeed more completely when in the company of some shrub or low-growing tree than against a wall, although in time a plant will get established in the latter position and do well.

**BEGONIAS FOR BEDDING.**—Tubers that have been resting may now be placed in a temperature of 50° to 55°. Should the press of other work prevent their being potted-up at once, they will do quite as well if simply laid on the inside border of a vinery or Peach-house that is being started; and they will take no harm here for some weeks to come. For potting, use a light compost, such as one consisting of two parts leaf-mould, and one each of loam and sand. This will induce the growth of plenty of fibrous roots.

**PANSIES AND VIOLAS.**—Should the stock of young plants be small, an increase may be made by dividing up the old plants. The smallest pieces of the young growths will succeed if carefully dibbled into sandy soil, and make good strong plants by bedding-out time. Place them in cold frames, and keep close for a few days, afterwards giving air freely.

**PETUNIAS.**—If seeds have not yet been sown to raise plants for bedding purposes, a sowing may be made soon; the seedlings will afford a very useful batch of plants, and possibly overtake those of a former sowing. Sow the seeds in well drained pans or boxes, and lightly cover them with sand or very finely-sifted soil. Place them in a temperature of 55° to 60°, and shade from bright sun.

### THE KITCHEN GARDEN

By G. HERRIN, *Gardener, Deptford, Maidstone.*

**PARSNIPS.**—Assuming that the gardener has prepared a piece of ground by manuring and deeply treading it, and has stirred the surface recently, the main portion of the Parsnip crop may be sown north-south. Before doing anything else, broadcast a mixture of soot and wood ashes over the land to be sown, then proceed to rake and level the surface roughly, afterwards tread it regularly and evenly all over; after which the drills, which should be about 15 inches apart, may be drawn. Where size of root is not the chief consideration, a part of the Parsnip crop may be sown towards the end of the month of April, as by sowing at that date excellent roots of good quality are obtained which, although small, are better suited for the best table than the large roots from the early sowing. Last year, our first sown Parsnip-bed was a partial failure, and it was hoed over and re-sown with fresh seed about May 20, and from this late sowing as good Parsnips were obtained as anyone could desire. Where a few extra large, clean roots are required for exhibition purposes, holes may be made with a large dibber or iron bar 1½ to 2 feet in depth and 6 inches in diameter, and at 18 inches apart each way, and filled with rich loamy soil, mixed with wood-ashes and soot which have been passed through a sieve with a half inch mesh. The soil should be pressed firmly into the holes, and three or four seeds sown in the middle of each patch, the number of seedlings to be reduced to one.

**STACHYS TUBERIFERA, CHINESE ARTICHOKE, OR COBNEE.**—These capital little tubers are not so generally cultivated as they deserve, and I would advise those who have not as yet given them a trial to grow a few this season. They are very hardy and productive; and a fair supply can be grown on a small plot of ground. I find three rows each of 25 yards in length will produce tubers sufficient for a daily supply at home, besides allowing for a quantity to be sent away. During the winter it forms a very acceptable addition to the list of available vegetables; and the tubers may be cooked and served in several ways, a very simple one being to boil them like Potatoes, and serve with white sauce. After boiling, they may also be fried with a little butter until rather brown, thus making a delicious dish. Owing to the mild weather, the tubers are making growth, and it has become necessary to plant the sets at an early date. The soil should be moderately light, and the sets planted in drills of 3 inches in depth, and 2 feet apart, the tubers being set at

9 inches apart in the row. By constant selection of the largest for planting, a slight increase in size of the tubers is obtained. The sets should be covered by drawing the mould over them with a rake, and very little after-attention is required beyond keeping the ground clear of weeds. A rather dry summer suits the *Stachys*, a wet season promoting too much top-growth and a large quantity of small tubers; it is therefore advisable to plant them in the driest part of the garden.

**JERUSALEM ARTICHOKE.**—This tuber may now be planted, giving preference to the white-skinned variety. Do not choose some shady corner of the garden as often happens, for the Artichoke pays for good cultivation and for being grown in good land in an open situation. Let the land be deeply dug and well manured, and plant in rows 2½ feet apart, half that distance between the sets in the rows, and 6 inches in depth.

**GLOBE ARTICHOKE** may have the greater part of their winter covering removed, just a little loose litter or bracken being left around the stems for a time as protection against probable frosts. There has been no loss of plants through the severity of the winter, but where there are gaps in the lines, these may be made good by strong suckers taken from the largest clumps and planted in pots, keeping these in cold frames till April.

**RHUBARB.**—The earliest Rhubarbs being now on the move, a portion should receive protection against frost from a slight covering of litter or bracken. Protected in this manner the stalks come of good colour, and will be large enough for use in a few weeks' time. This will render much more forcing of Rhubarb roots unnecessary from this date onwards. Where numbers of roots are lifted for forcing each year, as many old clumps as will afford the required number of new pieces should be lifted and divided. These divisions should be planted on ground that was heavily dressed with rotten manure, and trenched, setting them out in rows 4 feet apart, and 3 feet in the row, planting three or four good strong crowns on each station. When planting is finished, the ground around the plants should be covered with a mulch of rotten manure. No stalks should be pulled this year, but free growth encouraged.

### PLANTS UNDER GLASS.

By JNO. MOUNTREE, *Gardener, Woodside, Durlington.*

**PHACELLOMA.**—How seldom is this grand plant grown well! It is one of the best exhibition flowering plants, and a well-grown specimen is not easily excelled. It continues a long time in flower, and I have seen the same plant exhibited throughout the summer retain its freshness to the end. A cool airy greenhouse is the house the plant requires, and it should be light. The only method of propagation is by cuttings. Insert these in 3 inch pots filled with fine silver-sand any time during the spring. Avoid flowering shoots, and when inserted place the cuttings under bell-glasses, on a shelf in the greenhouse near the glass until rooted. This may take as long as two or three months, and when rooted, pot off singly into 3-inch pots, using two parts peat, one of light sandy loam, and one of silver-sand. The following spring these will be nice plants to shift on. Pinch the strong growths, and if specimens are wanted quickly it is well to prevent the plants flowering for two or three seasons. Specimen plants are best potted in February or March, using equal parts good fibrous sandy loam and peat, with a sprinkling of coarse silver-sand and charcoal. Water carefully for some time after potting, but when the plants are well established, a larger amount is required. Run-water is best for these plants, if it can be obtained, and next to that pond or river water. More hard-wooded plant specimens are lost from allowing them to get dry at the roots, than from any other cause. If these plants are regularly pinched, few stakes will be required; and if flowers are rather irregular, they can be regulated by means of green thread passed from one shoot to another.

**DWARF-GROWING STOVE PLANTS.**—Now is a suitable time to propagate *Oplismenus Barmanni variegatus* (Panicum), *Fittonia*, *Ficus*, *Peperomia*, and others similar. The method adopted here for propagating all plants of this kind is as follows: Three-inch pots are filled with a mixture of two parts peat, one part loam, and one part silver-sand, and several cuttings are inserted in each, and in the case of *Oplismenus*, I put as many as a dozen cuttings in a pot. Place them in a propagating box until rooted.

Of this last-named plant I seldom repot any, but prefer them in this size to any other, and as they become overgrown, I strike additional batches.

**PHYLLANTHUS NIVOSUS.**—Old plants may now be cut back and encouraged to produce young growth for furnishing cuttings; which, if struck in March, make nice plants for summer work. Grow them on rapidly in peat and loam, equal parts.

**BOUGAINVILLEA.**—This is an easily-grown plant, and when growing in a border and allowed plenty of room to ramble, it is a profuse bloomer, and remains a long time in flower. An intermediate-house is best suited to its successful cultivation. I have seen specimen plants which have been grown in a high temperature with abundance of moisture lose their foliage in a very young state. Propagation is by means of cuttings, using loam, leaf-mould, and silver-sand. Insert the cuttings singly in thumb-pots, and plunge them in bottom-heat. Young growths secured in April make the best cuttings. As soon as the cuttings have rooted, remove them to a shelf in the stove near the glass, and a fortnight afterwards shift them into 4 inch pots, using good loam and sharp sand. Plants struck in this manner and grown on all the season, will bloom nicely the following year about May or June. Messrs. Sander, of St. Albans, sent out a new variety of this plant a few years ago, plants of which grown in 5 inch pots I have seen full of bloom from the top to the bottom. Specimen plants that have been at rest during the winter months should now be overhauled, and all strong growths cut back; also all weakly shoots removed. After pinching, place them in a warmer house, and afford more water at the root. When they show signs of shooting, repot or top dress them as the case may require, using good fibrous loam and silver-sand. Water sparingly until the plants are well rooted. Bougainvilleas are not subject to the attacks of insects when grown in an intermediate temperature and supplied with a moderate quantity of moisture. Green and black-fly appear occasionally, and the plant being liable to injury if fagged, it is better to syringe it well with tobacco-liquor, sufficiently strong to destroy the fly.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

**FRUIT-TREE PROTECTION.**—The buds of Apricots, Peaches, and Nectarines are showing signs of bursting, and means must soon be taken to protect them from frost and cold winds. There are several kinds of material used for screens, and different methods of fixing and arranging these. The chief point to be kept in view is, that the trees require to be protected from frosts and cold wind, hail and snow-falls, and at all other times to be fully exposed. The less the trees are coddled, the less likely are they to be affected by the variable weather experienced during the month of March. Other points are to have the protective blinds, &c., so arranged that the trees may be quickly covered and uncovered, and on no account to adjust these so to allow any portion to come in contact with the trees. Copings of glass or wood are in themselves a great protection to wall trees, by keeping the flowers dry, and preventing to some extent radiation of heat from the substances of which the wall is made; and if a couple of thicknesses of ordinary fish-netting be fixed to the coping, and a number of light poles placed against the wall, and standing out about 3 feet distant from it at the bottom, and the netting tied securely to these, so as to prevent them blowing about, a simple and effective protection is afforded against frost and wind, but which admits light, and allows a free circulation of air. Such blinds, when once fixed, may be left up till the foliage protects the fruits. Curtains of Frigi Domo, fitted with strong rings made to run on two wires, one just under the coping and the other attached to posts standing about 18 inches high, and 3 feet from the wall, is an excellent kind of protection. These blinds, if made in lengths of 12 feet, are easily opened or closed, and if strongly made and taken care of, they will last for some years. When curtains of any description are used, they should be closed in the evening and opened in the morning, as soon as this may be done with safety. Sharp frosts sometimes come on at daybreak, when there were no signs the evening before.

**RASPBERRIES AND BLACKBERRIES.**—The newly-planted Raspberries and Blackberries should have all growths cut back to within 6 inches of the ground, and a mulching of manure placed over the roots.

## APPOINTMENTS FOR MARCH.

SUNDAY,	MAR. 1	Royal Horticultural and Agricultural Society of Great show.
THURSDAY,	MAR. 5	Linnean Society meet.
SATURDAY,	MAR. 7	Isle of Wight Horticultural Association meet; Soc. Franc. d'Hort. meet.
SUNDAY,	MAR. 8	Brussels Orchidéocose meet.
MONDAY,	MAR. 9	United Horticultural Benefit and Provident Society, Annual Meeting in Caledonian Hotel.
TUESDAY,	MAR. 10	Royal Horticultural Society Committee's show.
FRIDAY,	MAR. 13	Royal Botanical and Horticultural Society of Manchester show (two days).
SATURDAY,	MAR. 14	Royal Botanic Society meet.
WEDNESDAY,	MAR. 18	Royal Botanic Society's show; Devon and Exeter Gardeners' Association show.
THURSDAY,	MAR. 19	Linnean Society meet.
TUESDAY,	MAR. 24	Royal Horticultural Society Committee's show.
WEDNESDAY,	MAR. 25	Torquay Gardeners' Society's show.
THURSDAY,	MAR. 23	People's Palace Horticultural Society's show (three days).
SATURDAY,	MAR. 23	Royal Botanical Society.

## SALES FOR THE ENSUING WEEK.

MONDAY,	MAR. 2	Azaleas, Stove and Greenhouse Plants, Paeonies, Gladioli, &c., at Protheroe & Morris' Rooms.
TUESDAY,	MAR. 3	2050 Roses, Vallotas, Lilies, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	MAR. 4	Sale of the collection of established Orchids at Rooklands, Torquay, by order of the executors of Morton Sparke, Esq., deceased.
FRIDAY,	MAR. 6	Imported and established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°5'.

A Novel Experiment. THE eminent French astronomer, FLAMMARION, has lately communicated the following interesting report to a French journal:—

"We have undertaken at Juvisy the study of the various rays of the solar spectrum. A VIOLLES' registering actinometer with conjugated thermometers, a vapour actinometer, a CROOK radiometer, a registerer of the hours of sunshine, and several series of coloured thermometers are in constant use, and render it possible to calculate the calorific received according to the season, the hour of the day, the state of the atmosphere, &c. The object of these observations is to ascertain if there is not some relation in our atmosphere in the complex question of climate, between the calorific received from the sun and the state of that luminary.

In the course of these studies we thought it interesting to investigate the peculiar action of the sun on vegetation, which is a transformation of the solar energy. Which are the rays of the spectrum which act most efficaciously? It is possible to distinguish the luminous rays from the calorific rays and the chemical rays, to seek the characteristics which distinguish the slow radiation of the red end of the spectrum from the rapid radiations of the violet end, and to ascertain which are those that exercise the most favourable influence upon certain phenomena of vegetable life. With this object, we constructed glass frames with glasses which had been carefully examined with the spectroscope. It seemed impossible to find perfect violet rays, though twenty-two specimens were examined, for all allowed the passage of the yellow or green rays. We were, however, able to obtain blue glasses very near to violet, which only

allowed the passage of the rays from the right extremity of the spectrum. The red glasses are almost monochromatic, and only allow a little orange to pass. The green are less satisfactory.

We thus constructed, side by side in the same meteorological conditions, three frames, red, green, and blue; to which we added a transparent white glass, to enable us to compare the effects of full sunlight. In order to render the conditions as natural as possible, and avoid too high a temperature, the frames are ventilated by a current of air passing from south to north, but the light from outside cannot enter the coloured frames, even by reflection.

Among the many results which we obtained, it is interesting to mention the observations which were made on Sensitive-plants, which were chosen as subjects of experiment on account of their extraordinary sensitiveness.

The Sensitive-plants, all sowed on the same day (May 25, 1895), in the same soil, measured about 22 millimètres on July 4. We then made a selection of equally-developed plants, which were potted in perfectly similar earth, and left under a frame to recover from that operation. On August 1, the pots, each containing two Sensitive-plants, 27 millimètres in height, were placed in the coloured frames. By August 15, differences in growth, coloration, and sensitiveness were apparent, and became more and more marked. We registered the development of the impartial plate of a photographic apparatus, and the following are the results obtained:—

Dates.	Red.	Green.	White.	Blue.
	Mètres.	Mètres.	Mètres.	Mètres.
September 6 ...	0.220	0.070	0.045	0.027
„ 27 ...	0.345	0.150	0.080	0.027
October 22 ...	0.420	0.150	0.100	0.027

Thus the Sensitive-plants in the red frame attained an ordinary development, and reached a height fifteen times superior to that of those in the blue frame, which remained absolutely stationary. The red light produced the effect of chemical manure (though there is no question here of actinic rays). The plants were all cared for in exactly the same way—that is to say, simply watered.

The sensitiveness of the red plant reached such a degree that the slightest movement, a mere breath, sufficed to make its leaves close and all its branches droop at once. Moreover, the red plant flowered on September 24.

The white instead of growing in height, gained in strength, and became extremely vigorous. It showed buds. The foliage of the Sensitive-plant grown under red glass is lighter than that of the white, which is paler than the green; the blue is darker.

The difference between the temperature of the frames was not great, but the white was warmest. Next came the red, the green, and the blue. The luminous intensity decreased in the same order in much greater proportions.

Such is a summary account of the facts observed. Scientific experimenters, notably, MM. PFEFFER, PRILLEUX, SACHS, GUILLEMIN, DE FAMILTZIN, DRAPER, and PAUL BERT, long studied the action of various rays on vegetation. PAUL BERT'S results approach the more nearly to ours, though his experiments were not made in the country, but in the hothouse of the Faculty of Medicine, and between October and January, in a comparatively weak light. His result showed developments in the following order—white, red, blue, green.

We found, for growth in height, the following sequence, red, green, white, blue; and for vigour

and activity of vegetation, red, white, green, blue. The blue frame does not allow the passage of any red rays, but plants do not die in it.

We have observed similar phenomena, though less pronounced, with Geraniums, Strawberry plants, Pansies, &c. The Strawberry plants in the blue frame were not more advanced in October than they were in May.

In explanation of these phenomena, we would remark that, according to the experiments of MM. DEHERAIN, VESQUE, ENGELMANN, WIESNER, &c., the red and orange rays increase the respiration of the leaves and the assimilation of carbon, and favour transpiration, whence there must result an increase of circulation and nutrition.

These experiments were made at the station of Climatologie Agricole at Juvisy, with the assistance of M. GEORGES MATHIEU, Ingénieur Agronome."

PITMASTON DUCHESS PEAR (see Supplementary Illustration).—The fine large variety of the Pear Pitmaaston Duchesse, is so well known in this country that any description of the fruit is unnecessary in this notice. The particular tree forming the subject of our illustration is chiefly remarkable for its symmetry, large size, and its fertility, considering that it is growing in the "Black Country," a district not associated in the popular mind with salubrity or conditions favourable to plant-life. Mr. W. J. GILKS, gardener to H. SMITH, Esq., Summerhill, Kingwinford, to whose kindness we are indebted for the photograph, from which the wood-cut was prepared, remarks that the tree is growing in the gardens at that place, and the fruits taken from it last year numbered 423, and the weight 243 lb. The fruit was of good size, considering the dry season and the locality. He further says, that fruits of this variety fetch good prices, whilst others, as well known and as good, scarcely find buyers. The price paid for them by a Birmingham fruit-dealer was 4½d. per lb. for "Duchesses."

LINNEAN SOCIETY.—At the meeting held on February 20, Mr. C. B. CLARKE, F.R.S., Pres., in the Chair, Messrs. O. V. Aplin, Gilbert Christy, and W. O. Stentford, were admitted Fellows of the Society. Mr. Clement Reid exhibited a collection of acorns planted by rooks, and made remarks upon the agency of these and other birds in the dispersal of seeds. A discussion followed, in which the President and Messrs. Cole, Drury, Harting, and Kirby took part. Mr. Bernard Arnold exhibited and made remarks upon an abnormal growth of *Dactylis glomerata*, Linn., gathered at Shorne, near Gravesend, criticisms being offered by Messrs. B. Daydon Jackson and H. Groves. Mr. W. H. Lang exhibited under a microscope some prothalli of several varieties of *Nephrodium filix-mas*. These illustrated the spogamous production of the sporophyte which has been described in this species by De Bary and Kny. Dr. D. H. Scott and Mr. C. T. Drury took part in the discussion which followed. On behalf of Mr. E. J. Lowe, F.R.S., a paper was read by Mr. Drury, in which details were given regarding the culture of divided and re-divided prothalli of *Scolopendrium vulgare*. Apart from the fact that by such subdivision, and the consequent separation of parts bearing archegonia and antheridia, the oophoric stage of Fern-life was maintained for a number of years without the sporophoric generation appearing, the ultimate results when fertilisation eventually took place were very remarkable. In numerous instances several marginal plants appeared on the same prothallus, of presumably the parental type, but single plants originating from the centre of each prothallus were, though of varying character, all distinguished by bearing prothalli upon their edges or terminal points, such prothalli developing root-hairs, archegonia, and antheridia, although the young plants had formed a distinct axis of growth, and thrown up a circle of such aposporous fronds. The paper embodied also the observations of Mr. C. T. Drury, Professor F. O. Bowyer, Professor

PITMASTON DUCHESS PEAR.

Farmer, Dr. Scott, and Mr. Lang, on material sent to them; and one of the plants in question, clearly showing the aposporous growth, was exhibited by Mr. Drury in illustration. A discussion followed, in which Dr. Scott, Mr. Lang, and Mr. Drury remarked upon the interesting nature of these and similar breaches of the law of alternation of generations in the Archegoniata.

— An evening meeting will be held on Thursday, March 5, 1896, at 8 P.M., when a paper will be read on 'Segmentally-disposed Thoracic Glands in the Larvæ of Trichoptera,' by Professor GUSTAV GILSON.

**GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—To further the cause of the Gardeners' Royal Benevolent Institution, and to make its many advantages better known amongst gardeners in Devonshire, it has been resolved to hold a public meeting in the Guildhall, on Wednesday, March 4, at 7 in the evening, under the auspices of the Devon and Exeter Gardeners' Association. The President of the association (C. R. COLLINS, Esq.) will occupy the chair, and among the speakers will be Mr. Harry J. Veitch, Hon. Treasurer of the Gardeners' Royal Benevolent Institution; Mr. G. J. Ingram, Secretary; Mr. J. H. Vallance, Hon. Sec. and Treas. of the Bristol and Bath Auxiliary; Mr. P. C. M. Veitch, of Exeter; and others, who will explain the aims and work of the institution. It is to be hoped that Devonshire will be enabled to form an auxiliary-branch similar to those existing in some other counties.

**BIRMINGHAM GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—At the Athletic Institute on Monday evening, Feb. 17, Mr. W. B. LATHAM presiding, Mr. JAMES MARTIN (the manager of the Nursery Department of Messrs. SURTON & SONS, Reading), delivered an interesting discourse on the cultivation and evolution of the Cyclamen and Chinese Primrose (*Primula sinensis*). His remarks were illustrated with a numerous display of cut blooms, comprising several of the newest novelties. In addition to the latter, an interesting series of photographs were shown. Mr. JOHN POPE, the Nurseries, King's Norton, exhibited a fine umbel of *Clivia miniata*; Mr. C. BICK, an improved form of the well-known *Primula obconica*; and Mr. MUSTEN, Moseley, cut flowers of a very fine strain of *Cineraria*.

**READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—An interesting and instructive lecture on "some common Insects of the Kitchen Garden and Orchard," was given at a well-attended meeting of this association on Monday evening, by Mr. JAMES STEWART, horticultural lecturer to the Oxfordshire County Council. The insects described included millipedes, wire-worms, Onion-fly, Carrot-fly, Pea-weevil, Celery-fly, Turnip-fly, Apples-blossom weevil, winter moth, Codlin moth, Nut-weevil, Currant-mite, Raspberry-moth, Magpie moth, Gooseberry-sawfly, and Lady Bird, all of which were illustrated with drawings shown by means of the magic lantern. In the discussion which followed, much useful information was disseminated respecting the ravages, and best methods of dealing with the various pests; and a very hearty vote of thanks was accorded the lecturer.

**HEREFORDSHIRE FRUIT AND CHRYSANTHEMUM SOCIETY.**—On the occasion of the retirement of Mr. OUGH from the post of secretary to this society, the members determined to present him with a copy of the work the *Herefordshire Pomona*, and the annual general meeting on Wednesday, February 19, was selected as the day for the presentation. The Deputy Mayor, Mr. W. J. HUMPHREYS, presided, and among those gentlemen present were Aldermen E. E. Basley and T. Carver, and Messrs. J. Cranston, J. Watkins, J. Wilson, C. Whiting, C. Williams, W. Nash, and G. Child. Mr. Ough, on receiving the volume from Mr. Humphrys, sincerely thanked the donors for the handsome present made to him in a few well-chosen sentences. At this meeting, Mr. Carver proposed that Sir Joseph Pailley be elected President. Mr. R. M. Whiting seconded,

and it was carried *nem. con.* The Mayor of Hereford, on the proposition of Mr. Watkins, seconded by Mr. C. Whiting, was elected Vice-President; and Mr. J. H. Hewett becomes secretary.

**FORTUNATE GARDENERS.**—The late Mr. W. B. MILLER, of the Elms, Ramsgate, who was justly celebrated for the many excellent zonal Pelargoniums he raised, and which have been distributed for a great number of years past by Mr. H. CANNELL, left in his will the sum of £20 to Mr. A. MAYES, Messrs. CANNELL'S Pelargonium grower and foreman; also a like amount to Mr. BLACKETT, who was for a considerable time gardener to Mr. MILLER.

**ERIDGE CASTLE.**—Considering the liability to fire of our country mansions, it is satisfactory to find that only one room at Eridge Castle, near Tunbridge Wells, was destroyed by fire on Sunday last.

**THE SURVEYORS' INSTITUTION.**—At the ordinary general meeting, held on Monday, February 17, 1896, the President (Mr. DANIEL WATNEY) in the chair, a paper was read by Mr. A. A. HUDSON (Associate), entitled "The Conditions of Building Contracts." A discussion followed, and was adjourned to the next meeting, and a vote of thanks was unanimously passed to Mr. HUDSON for his paper. The next ordinary general meeting will be held on Monday, March 2, 1896, when the adjourned discussion on the paper read by Mr. A. A. HUDSON at the last meeting, entitled "The Conditions of Building Contracts," will be resumed. The chair to be taken at 8 o'clock. The Annual Dinner, 1896.—Many members having expressed an opinion that the annual dinner of the institution might, with advantage, be held earlier in the year, and the Council having found, from experience, that it is difficult to secure the presence of some official guests on a Monday evening, it has been decided this year to hold the annual dinner on Wednesday, March 18, at the Whitehall Rooms (Hôtel Métropole). The Council are inviting many distinguished persons as guests. Junior meetings.—The third of four meetings of examinees and students authorised (subject to certain conditions) by the Council to be held during the present session, will take place in the Lecture Hall of the Institution, on Monday, March 9, 1896, when a paper will be read by Mr. T. G. CHAMBERS, entitled "An Analysis of Value." The chair to be taken at 7 o'clock.

**"ARCHIVO RURAL."**—This is the title of a new Portuguese publication devoted to practical agriculture, and especially to Vine-culture. The publishing office is Rua 2, Campolide, Lisboa, Portugal.

**EALING GARDENERS' ASSOCIATION.**—At the last meeting of the Executive Committee of this body, it was decided to organise a smoking concert, to take place on March 18 next, in aid of the Gardeners' Orphan Fund, a form of entertainment that will doubtless, be successful.

— At a recent meeting of the members, S. A. SEWELL, Esq., in the chair, Mr. A. WRIGHT, Falkland Park Gardens, gave an admirable paper on "Cool Orchids." The lecturer illustrated his remarks by photographs of Orchids, besides describing the kinds of houses best adapted to the cultivation of these plants. He also touched upon composts, &c.

**PRESERVATION OF ORANGES.**—The preservation of Oranges is a matter of very great importance to colonial cultivators of this fruit for export purposes. Have growers generally paid any heed to Mr. CARSON'S experiments at Kew, where he buried recently, under 3 or 4 inches of dry earth, a quantity of Oranges, and, after over six months, found the fruit quite sound and perfectly ripe? Have we here a hint of a new method of packing for export? *Colonies and India.*

**A ROSE EXHIBITION AT FRANKFORT IN 1897.**—We gather from the German horticultural journals recently to hand, that the Rose Society of Frankfort-on-the-Maine intends to hold an exhibition of Roses in that city next year. Frankfort, being the junction of many railway lines, is peculiarly well situated in

regard to its communications, and an exhibition is certain to be visited by persons from far and near. The venture has as its patroness Her Imperial Majesty the Empress FRIEDRICH, who is also patroness of the German Amateurs' Rose Society, and it is, moreover, well supported by persons of rank and standing. As it is probable that the amateur society above-mentioned will hold its conference next year at Frankfort, the attendance of visitors will on that account also be greatly increased.

**DR. L. BUSCALLONI.**—This gentleman, formerly assistant in the botanical garden, Turin, has removed to Göttingen, as assistant to Prof. Dr. BERTHOLD.

**PRESENTATION.**—On Saturday evening, Feb. 15, a handsome presentation was made to Mr. JOHN AUSTEN, late head gardener at Witley Court, who has recently retired from that position to become the landlord of the Hundred Horse Hotel. The presentation consisted of a service of plate, and included tea and coffee service, a fluted punch-bowl, together with a dozen handsome candlesticks, in three different patterns. Accompanying the gift was an address, suitably framed, which had been tastefully executed and which bore the names of forty-two subscribers. It should be mentioned that the presentation was intended to have been made at Christmas, but was unavoidably delayed. A few weeks ago a marble timepiece was presented to Mr. AUSTEN by the gardeners and other employés who had been employed under him at Witley Court.

**TECHNICAL INSTRUCTION IN HORTICULTURE IN ABERDEENSHIRE.**—Under the auspices of the Aberdeen County Council, Mr. JAMES WILSON, St. Andrews, delivered on Tuesday, Feb. 18, the first of a series of lectures on horticulture in the Town Hall, Kintore. There was a capital attendance, and Mr. WILLIAM TAIT, LL.D., convener of the Technical Instruction Committee of the County Council, presided. Mr. WILSON gave another lecture at the same place on Thursday evening, 20th inst., when there was a good attendance. On this occasion the subject of the lecture was "The Culture of Fruits," which proved highly instructive and interesting. The lecturer had the aid of the magic-lantern in illustrating some of the more salient points of this lecture, and at the close, he gave some practical demonstrations in pruning, grafting and budding.

**"DICTIONNAIRE PRATIQUE D'HORTICULTURE ET DE JARDINAGE."**—The French translation of *Nicholson* has now reached its forty-sixth part, which concludes with *Palafoxia*. This coloured plate, given with the present number, is devoted to *Papaver bracteatum* and *P. orientale*.

**M. COGNIAUX.**—The *Journal des Orchidées* for February 16, contains an excellent likeness of M. GOONIAUX, whose work on the Cucurbits and Melastomads, gives the best augury for the excellence of the similar work on which he is engaged with reference to the Orchids.

**BACTERIA.**—Word of direful potency! The literature relating to these elementary creatures is now voluminous and scattered. Botanists and microscopists who wish to get a general idea of the nature and classification of these plants may therefore be glad to be reminded that the 129th section of ENGLER & PRANTL'S *Die Natürlichen Pflanzenfamilien* contains an exhaustive summary of the subject from the pen of Dr. MIOULA. Numerous illustrations do much to render the text available, even to those who do not read German.

**A TRAIN STOPPED BY SLUGS (LIMACÆAS).**—According to the *Journal of Malacology*, a train in the country of Tanis was brought to a standstill by a horde of slugs, which, on being crushed by the wheels, rendered the rails so slippery that the wheels could only revolve and not grip the rails. A similar story was told some time ago of an army of caterpillars crossing the rails and rendering them impassable.

**JARRA TIMBER.**—According to an official report presented to the Government of New South Wales, the Jarra, or *Eucalyptus marginata*, is never

attacked by the boring *Terado navalis*, also called "Cobra," and is in consequence largely used in Australia for piles. The Turpentine-tree (*Syncarpia laurifolia*) is also serviceable from this point of view, though less so than the Jarra; but it is requisite that the bark be not removed.

**FOOD VALUE OF FRUITS.**—A very common article upon this subject appears in the number of *Old and Young* for February 22. The author, M. HYLAND, speaks of the nutritive properties of ripe fruits, and of nuts, and of the valuable qualities of certain fruits in certain ailments, in cases where the digestion of the patient will admit of his taking such fare.

**CARNATION RUST.**—It appears from the experiments carried out at the Cornell University Agricultural Experiment Station, that this disease, caused by *Uromyces caryophyllinus*, can be effectually controlled by spraying with Bordeaux Mixture with a little soap added to make the mixture more adhesive.

**POTATO SCAB.**—An application of 300 lb. of sulphur to the acre has been tried with great success in the New Jersey Experiment Station. This is a safer remedy by far than the application of corrosive sublimate.

**SPRAYING FRUIT TREES.**—1. Spraying is only one of several means or operations which the pomologist must master if he aspires to the greatest and most uniform success. Other fundamentally important requisites are tilling, fertilising and pruning. 2. Spraying is not necessary to successful results every year, but inasmuch as the farmer cannot foretell the need of the operation, he should spray as a matter of insurance. 3. Spraying is almost sure to be of some benefit every year, particularly upon Apple, Pear, Plum and Quince trees. 4. Spraying is of little consequence unless carefully and honestly done. The spray must actually reach every point which it is intended to protect. 5. Prepare for the year's campaign during the previous winter, by reading the latest teachings, and by completing pumps and appliances. Give particular attention to a convenient wagon outfit. 6. The Bordeaux Mixture need not be made up at each using in the exact numbers of the formula. The copper sulphate may be permanently dissolved in water, and the lime may be slaked. When the mixture is prepared, the stock solution of vitriol is diluted, the lime added, and the tank filled to the required amount. 7. Spraying is well nigh futile unless the operator understands precisely what he sprays for. 8. The time to spray is when the operation is needed to protect the plant. This will vary, therefore, with every season and every different part. In general, we advise spraying Apples and Pears twice, first when the flower-buds open but before the flowers expand, and again when the blossoms fall. 9. The presence of soluble arsenic in Paris Green may be determined by a test with sulphuric acid and hydrogen. 10. Pure Paris Green dissolves completely in ammonia, giving a rich deep blue liquid. 11. The arsenic which falls upon the soil seems to become or to remain in an insoluble condition, and passes downwards, if at all, to a very little distance, and then only by the mechanical action of water in carrying it through spaces in the soil. 12. The canker-worm can be killed by honest spraying with Paris Green, 1 part to 200 gallons of water. *L. H. Bailey, Abstract of Bulletin No. 101, Cornell University Agricultural Station.*

**IMPORTS OF JAPANESE BULBS.**—The United States Consular officials in Japan, says the *American Florist*, still forbid the exportation of bulbs and plants to the United States, and the import trade in these is at a standstill. The order was originally issued through fear of the bulbs and plants carrying cholera germs, but as nearly as we can learn, there has been no cholera in Japan since last November, and it certainly seems inconsistent to prevent the importation of plants and bulbs when Oranges, Tea,

Rice, and silk are freely shipped. To exclude the tree and still admit the fruit seems ridiculous.

**TECHNICAL INSTRUCTION.**—A course of six lectures on "Fruit Culture" is in course of delivery at Barnet, in connection with the Hertford County Council, by Mr. D. T. FISH. The following is the programme of the subjects treated on:—

**LECTURE I.—THE APPLE.** PLANTING.—Time, mode, distance, transplanting. FORMS AND SIZES OF TREES.—Standards, dwarfs, pyramids, espaliers, &c. PRUNING. Summer, winter, root. GENERAL CULTURE. Mulching, watering. SUB-CROPPING with grass, vegetables, flowers, bush-fruit, Strawberries. BEST VARIETIES for profit, kitchen and cooking, table, preserving, cider, cottage gardens, special localities. THE HARVESTING OF APPLES. Gathering, storing, picking. DISEASES OF APPLES.—Canker, mildew, mealy-bag, aphides, maggots, caterpillars, weevils, antidotes, cures.

**LECTURE II. THE PLUM.** VARIETIES.—Gages, dessert, kitchen, Prunes, Damsons. PLANTING.—Time, distance, method. GENERAL CULTIVATION.—Pruning, training, GATHERING.—Packing, drying, and preserving. PREVENTION AND CURE OF INSECTS AND OTHER PESTS.—Blight, barrenness, canker, gum, red spider, grub, aphides, saw-fly, white scale, beetles, earwigs, ladybirds, weevils.

**LECTURE III. THE PEAR.** VARIETIES. For particular purposes and places. PLANTING.—In orchards, in gardens, distance, time, mode. CULTIVATION. General and special. PACKING. DRYING. PESTS AND DISEASES, their prevention and cure.

**LECTURE IV. THE CHERRY.**—Planting, pruning, training, cultivation.—LEADING VARIETIES.—Burgundy, Geans, Dukes, Morellos. PESTS AND DISEASES, their prevention and cure. BUSH FRUITS.—THE GOOSEBERRY.—Conditions of successful culture.—Planting—pruning—training—general and special culture—green and ripe. CURRANTS.—Red, white, black, special pruning of hick, best varieties. PESTS AND REMEDIES.

**LECTURE V. THE RASPBERRY.**—Time, mode, distance of planting, pruning—training—general culture—varieties—single and double bearing—uses. THE STRAWBERRY.—Uses—planting—best soils and manures. Special culture in beds, rows, raised banks and pots—forcing the Strawberry—retarding ditto. VARIETIES.—Early, mid-season, late—best and best.

**LECTURE VI. MUSHROOMS.**—For food or profit. The Start—materials for Mushroom beds, inside or out of doors. The growth of Mushrooms without beds. Temperature—spawning—casing—covering. Early and frequent gathering. Growing in the dark as well or better than in the light. How to prevent or destroy wood-lice, snails, or slugs.

**SPRING ROOT CROPS,** such as Potatoes, Carrots, Turnips, Onions, Beetroot.

## PLANT PORTRAITS.

*ROSE, WHITE MARECHAL NIEL*, *Rosen Zeitung*, No. 6, 1895.

## THE CULTURE OF THE CYCLAMEN.

The Cyclamen should be one of the gayest and most useful flowering plants in our cool greenhouses from November until April. In private gardens, however, it rarely receives proper attention, and in the large majority of such places the plants compare very unfavourably with collections grown by market gardeners. In these circumstances there is no wonder that they are not more extensively grown by amateurs; nevertheless, the fault lies with the treatment rather than with the subject. The Cyclamen, in common with all other plants, has its peculiar requirements, and if the best results are to be obtained these must receive attention. Give the plants such treatment as I shall endeavour to set forth in this short article, and I am confident that the Cyclamen will supplant in popular favour the Chinese Primula, about which so much is said, and written. I venture to assert that if

any who were prejudiced against this subject, had looked in at the Drill Hall, Westminster, on the 8th inst., and seen the effect produced by two splendid collections of Cyclamens, they would not hesitate to declare it one of the most useful of our cool greenhouse plants.

I usually sow the seed thinly in pans about the middle of September. Plenty of drainage is essential both now and at subsequent transplantings. When watered, the pans are placed on shelves in the plant-stove. As soon as the seedlings have made one leaf, they are pricked off thinly, say 2 inches apart either way, in pans or boxes, and replaced on shelves, or in other convenient positions, near the glass in the plant-stove using the syringe briskly over them frequently. From the beginning to the middle of February is a good time to shift the seedlings into thumb-pots. The soil should be as follows:—Loam, leaf-mould, sand, and cocoanut fibre refuse, in equal parts, to which should be added a liberal quantity of finely-broken charcoal, and the whole passed through a half-inch sieve. Place the pots near the glass on a cool ash bottom, still maintaining a stove temperature until the roots appear in numbers round the sides of the pots, when they should be removed to slightly-cooler quarters, and there remain until the final potting takes place. This should be done about the first week in May. I have found 48 size, or 4½-inch pots, most suitable for the plants to flower in. Drain them well, and use fibry loam two parts, leaf-soil one part, sand one part, a dash of soot, and some broken charcoal. Press the soil moderately firm with thumb and finger, eschewing the use of rammer. Place the pots on coal-ashes in a cold frame, with a southerly aspect, and keep close for a few days. The foliage should be slightly moistened twice daily in bright weather, but no water must be given at the roots for at least ten days. When growth has fairly commenced, more air should be admitted by tilting the lights top and bottom, which will allow a brisk current of air to pass freely amongst the foliage. Shading should be afforded in very bright weather until 2 P.M., when watering having been completed, the plants and surfaces of frame should be liberally syringed, and the lights closed tightly, allowing them thus to remain until 5 P.M., when air may be admitted. In fine weather, the lights may advantageously be taken entirely off the frame. A little soot may be added to the water when the plants are thoroughly well rooted; but I have found that, under the best treatment, no stimulant is required till the end of August. About October 1 the plants should be housed. If possible, put them in a well-aired, low-roofed structure, and arrange the staging so that the plants may stand near the glass. Scauden's manure may be given once weekly when the flowers are showing freely. The temperature should now be kept as low as possible, merely excluding frost. *J. F. MacLeod.*

## METHODS OF PROPAGATION.

**I. WINTER OR INSIDE GRAFTING.**—I. will be convenient if we take first the method of "inside grafting," as it is called, to distinguish it from the ordinary operation performed in the open air.

In Belgium, Holland, France, and probably on the continent generally, this process has been adopted for a very long time, and as we come to learn foreign methods better, and to employ Belgian and other than English propagators in our nurseries, their methods are adopted. This is especially the case in propagating new Roses, Indian Azaleas, and Rhododendrons.

Time was when such plants as Camellias, and the before-named plants, were only increased by layering, and I remember well seeing the healthy stools of Camellias in the now-forgotten nursery of Chandler & Son, in the Wandsworth Road. But now, if I may say so, the market is glutted with Belgian and Dutch plants, almost without exception grafted in heat. When I write upon layering, I propose to make a few remarks in disparagement of grafted plants, and in favour of those raised by layering.

## ROSES.

Let us take the Rose first, as it is by far the easiest subject for a beginner to manipulate. The stock usually employed is the Italian or Manetti, but all are available, as the seedling or cutting Briar, the Grifferaie, or the so-called Napoleon stock, are highly approved by some propagators. These must be potted into small 60's as soon as, or even before, the leaf falls (better, where possible, even the March before they are wanted for use). The pots should be plunged in spent tan or other light moisture-retaining material, and turned occasionally to prevent rooting through, and so, when lifted, receiving a rude check.

The scions should be cut at the end of the autumn, and laid-in by the heels in a sheltered

because it is here only that the vital process tending to form fresh wood-cells goes on. No tonguing, so-called, is necessary, but avoid using too pithy scions; bind all firmly with soft raffia, and paint or smear over the tie some soft clay made into the consistency of cream by added water; stand the plant aside to slowly dry, and proceed till all are properly finished. They must then be plunged in cocoa refuse under the lights of an inside propagating-pit, and a temperature of from 75° to 80° kept up. In a week or ten days the grafts will be found pushing their buds, when the ties may be loosened, or they will cut into and injure the base of the scion. Should all have been done skilfully, within six weeks from operating the young plants may be taken from the inner pit and placed on the stage to harden off a

are all stock; the vigour of the Italian Briar has choked the Roses, and you can now do nothing but grub out the whole and plant a fresh. The "Da la Grifferaie" is almost equally troublesome, but the large dark-green and strong shoots of this species are so distinct, that they are rarely mistaken for that of the Rosa proper; nevertheless, the last foster-mother is useful for budding strong-growing Tea Roses, and for climbing Noisettes of the "D'jon" race, while the Briar is preferable for all the H. P.'s, and the "Napoleon" stock for weakly Teas and Noisettes, but there is no hard and fast rule for this.

The best label for pot-Roses is a narrow triangle of soft lead, punched with numbers, and lightly wound round the stem of your Rose; but when you plant out see the "Acma" labels, they are most slightly, permanent, and effectual. *Experience.*

(To be continued.)

## HOME CORRESPONDENCE.

GARDEN MACHINERY.—It would appear that the application of mechanical power to the working of lawn-mowers and rollers is attracting some attention in the gardening world. Having had, within the last few days, an opportunity of inspecting the machines lately brought to a state of efficiency by Mr. Stephenson-Peach, of Ripton, near Derby, I venture to send you some particulars of them, thinking the account may prove interesting to some, at least, of your many readers. I had the pleasure of seeing at Ripton, three machines, each differing from the others in its mode of propulsion. The one to which I shall especially refer, is driven by a petroleum engine—that class of motor so much used now in propelling the new horseless carriages. I saw this machine tested in every possible way, and notwithstanding that several hours of drizzling rain had made the ground almost unfit for the purpose, and on which it would have been out of the question to work a horse-machine, the trial gave entirely satisfactory results. The machine is managed with the greatest ease, a person seated on the front part of it, with a lever in each hand, starts, guides and stops it at will and with perfect certainty. The facility with which it is steered is perfectly marvellous; to show what it could do in this way, it was made, at one part of the trial, to turn round and round on one spot not much greater in diameter than its own length. There is no smoke, and the noise made by this machine, which cuts and rolls a width of 3½ feet, is no greater than would be caused by a horse-machine of equal width. The mower can be easily detached, and the machine used for rolling carriage-drives, &c. It can also be employed in pumping, sawing, or even threshing, by connecting the fly-wheel, by a belt, with appropriate machinery. It would be out of place here, and would take up too much space, to give particulars of the mechanism, but the whole machine clearly shows that an immense amount of thought, time, and money, has been expended on it, and those who are interested in the keeping of pleasure-grounds, drives, &c., in a state of perfection, may feel assured that the machine for doing this efficiently and economically is an accomplished fact. Through the very fitness of things, this kind of implement must take its place as part of the indispensable equipment of every garden, public or private, containing pleasure-grounds of any considerable size. I may briefly notice, in conclusion, the other two machines to which I have alluded. One is a large steam-roller and mower, taking a width of 4 feet; this was in the shop, waiting for its steam-generator to be put in place. The other is a smart, handy, garden-roller, driven by electricity. Killing with this is simply a delightful amusement. Its employment, however, would be limited to those places having a supply of electricity available. In the light of long experience in the care of large gardens, I look on these machines with the utmost favour. *G. Don, Hawkhurst, February 21.*

THE RAILWAYS AND THE CARRIAGE OF GARDEN AND FARM PRODUCE.—The new tariff of rates of carriage, and the prices of the boxes sold over the greater portion of the Great Eastern Railway system, will prove a great boon to producers and consumers, and it is to be hoped that the labour and worry saved in the abolition of returnable empties, will go far to compensate the company for its bold and general reduction of charges. I find, as anticipated,

HIS GRACE THE DUKE OF BEDFORD.

The New President of the Royal Gardeners' Orphan Fund. The portrait is from a photograph by Mr. J. Thomson, of 70A, Grosvenor Street, London, and it is published by permission of His Grace. (See p. 273.)

corner, or even under glass in northern districts. This prevents the possibility of freezing, which, especially in the Tea Roses, and those allied to them, often impairs the vitality of the young wood and inner bark, on the healthy state of which success depends. When it is proposed to commence grafting, the stocks wanted for use should be taken from their bed and placed under the stage of the propagating-pit or intermediate-house, when the increased temperature will soon excite them, and their buds will begin to swell up, thus indicating that the sap is beginning to circulate. Now take a stock firmly in hand, and with a sharp knife (none better than Saynor's 207 budder) cut it through with a clear, slanting incision, as near to the soil as convenient. Then cut a scion from your Rose-wood, having from two to four eyes, and at once adapt it to the cut stock, taking care that the edges of the bark of the scion and of the stock meet,

little, taking care to shade from the meridian sun. In about a week the young Roses may be potted into 48's, being careful to pot firmly, and to cover the union over with the putting soil, thus enabling the scion to root freely into this, and so secure a well-established plant. Keeping the young plants well syringed and free from aphids, you will have a healthy batch of pot-Roses, either for filling up any vacancies in summer, or for pot-culture.

The Manetti stock is good for all classes of Roses, but is apt to throw up numerous suckers, and to grow too strong, even choking the graft or bud. Frequently has this happened to me. "Oh, Mr. Experience, I'm so glad you've come. I want your advice (gratis, of course) about my Rose-beds." Being introduced to these, what do I see? A veritable forest of branches and foliage! "The Roses look well, do they not, but I get no good Roses—how is this?" The answer is prompt—because your beds

that other companies, notably the Great Western, have already endeavoured to equal or better the good example of the Great Eastern, but on somewhat different lines. This and other great lines will probably yet establish a penny rate for small parcels—say, pounds, pints, quarts—of Strawberries, Cherries, Gooseberries, Currants, Plums, during the season, irrespective of distance. This would bring fresh fruit into the homes of all classes during the fruit season, check one of the greatest hindrances to the rapid extension of fruit-growing and help the consumption of local gluts of fruit in their season, and establish flower, fruit and vegetable industries on a steadier and more profitable basis. The breaking up of fruits, flowers and vegetables in bulk into more manageable, tempting, and smaller lots, is one of the vital changes necessary to quadruple or multiply indefinitely the area of production, and of consumption. The foreign competition now so strong as almost to drive home products out of Covent Garden, and other markets, teaches the same lesson. The packets and boxes are mostly light, presentable, and non-returnable. Even the barrels of Apples are handy to move, and can be readily and speedily placed on van or rail. The thousands of boxes, baskets, and packages of Narcissus, Roses, Violets, and other flowers, Tomatoes, &c., that crowd the markets are so light and strong, that the costers who purchase them so freely carry them off in piles for their customers with little risk of injury. So sure are these sharp purchasers of the uniformity of samples, that scores of boxes are often sold at three or four shillings per box, as the case may be, faster than one can write down the fact. The Great Western Railway, however, has offered to meet the growers in the aggregation of quantities rather than in the lowering of rates for small quantities. They offer very special reductions for three or two-ton quantities. Of course, if a number of growers in a district will only agree to lump their consignments from and to given stations, the railway authorities can treat them as one, and charge the wholesale instead of small parcel rates. But this is not all: it seems that the Great Western, whose lines in the counties of Devonshire, Cornwall, Wiltshire, Worcestershire, Gloucestershire, and Somerset cover some 2500 miles, has for some time past been trying an entirely new departure in the collection of certain classes of goods, such as ducks which they have collected, carried, and sold for a charge of something like 2s. a head. The company is prepared to extend the collection to other garden and farm produce. Taking certain rural centres, the Great Western is sending out men to the various farms in the district, and receive produce from the farmers without requiring the latter to pack it. The collectors carry baskets with them for the purpose, and also cloths for wrapping up any poultry, pork, or other perishable products that may be handed to them. Thus collected, the produce would be consigned to London or some other centre, forwarding the proceeds, minus their own charges, to the owner. As to the amount of the charge, 2s. per head of ducks, it affords a useful standard of comparison; and it is said that a Wiltshire farmer, under the new tariff, would pay about 1s. 9d. per cwt. for the collection, carriage, and sale of his meat. Similar or even lower rates will be arranged for flowers and fruits, the producer doing nothing but hand his consignment to the company's collector at his door, and then wait for his cheque in return when the collector returns for more. A combined cargo of 3 tons may be carried in a 10-ton truck at the rate of 10-ton truck. The nearest approach to this plan of collecting goods for carriage that I had previously heard of, consisted in the Great Eastern running some waggons into fruit orchards on the line, and hooking them on to fast passenger trains when laden. One would think that there is little more to be done in the collection, conveyance, and sale of garden and farm produce—unless, in the facetious words of the *Times* correspondent, the railways also undertake to grow the produce for the farmers. But the Agricultural and Horticultural Association, and other friendly and co-operative societies, as well as the National Agricultural Union, are taking a lively interest in this matter; and doubtless such societies can powerfully assist this movement for lower rates and more perfect distribution in many ways. The members of these societies are sufficiently numerous to form good markets among themselves for their own and other products grown in gardens and on farms. It may also be hoped that through the great annual national flower show at the Crystal Palace, the spread of horticultural literature through the press, lectures on

technical education, &c., the love of horticulture and its products which are daily growing wider, deeper, higher, the lowest and most popular tariffs will return the highest dividends. *D. T. F.*

**DENDROBIUM DALHOUSIANUM.**—This is a very noble species, and a specimen plant, when in full flower, is a striking object in any hothouse. *D. Dalhousianum* is one of those Orchids that can be depended upon to keep up its stamina for any length of time. I bought a plant of small size and in poor condition about twenty-five years ago; it had growths from 1 foot to 18 inches in length. This same plant has now growths 5 feet long, and I exhibited it at the Crystal Palace in a 1st prize collection with thirty-six spikes of flowers upon it, and two good plants have also been taken from it. I do not know any *Dendrobium* that takes so long to make up its growths. They start early enough, but are not completed until November. Our plants of this species are placed in a house with all other *Dendrobiums* requiring much heat, as soon as the flowering period is over, which is generally by the middle of June or earlier. If repotting is necessary, this may also be performed before they are put into the warmest house. The plants should not go short of water while in this high growing temperature, and the surface of the compost should not be allowed to become dry at this time; the sphagnum-moss remains, therefore, in luxuriant growth. The plants are placed as near the roof-glass as possible; in fact, I have them so that the young shoots come in contact with it in the autumn, but they are tied down as they grow to prevent their touching it. I have had four and five spikes on one stem, but have never ventured in the resting season to place them in as low a temperature as *D. nobile*, *D. Wardianum*, and others of this type. The plants rest in winter in the Cattleya-house, which has a minimum temperature of about 55°. In this temperature all such species as *D. thysidiorum*, *D. Paxtonii*, *D. Farmerii*, *D. Brymerianum*, and others are rested. *J. Douglas.*

**FREESIA CULTURE AT SUFTON COURT.**—For the past twenty years I have been a great lover of *Freesias*, and have been told of late years that I grew them well, and that by good gardeners. Hearing that Mr. Leech at Sufion Court had a batch surprisingly good, I paid him a visit. It was soon plain that I had not been misinformed, for I never saw such plants. They are in 6 inch pots, have grown nearly 2 feet high and through, whilst the flower-spikes are much branched, and the flowers large. Mr. Leech was good enough to furnish me with particulars of the treatment they receive, preferring to tell me first how he treats them at this season. They are kept on a shelf in a greenhouse temperature, and are watered with weak soot-water. After flowering, for the next five weeks he gives them liquid-manure, and does all he can to get fine bulbs. As growth ceases, he gradually ripens them off, watering them with clean water, and the plants are then placed in the hottest spot outdoors. Early in June, the plants are shaken out, and the bulbs put in shallow boxes or pans. They are then placed on a greenhouse shelf in full sun until early in August, when they are re-potted. The 6 inch pots are well-drained, and the mixture consists of equal parts leaf-mould, old mortar, fresh dry horse-droppings, and a good sprinkling of silver-sand. The bulbs are covered 1 inch deep, and are placed nearly 1 inch apart. The pots are then stood in a very sunny spot in the open, and receive only just sufficient water to start them. At the end of September they are taken to a cold frame, and remain there until the middle of October. They are afterwards put on a vinery-shelf near the glass for the winter, and watered sparingly. *W. E.*

**FRUIT-FARMING.**—What I meant in my last note (p. 242) is this: it should be ascertained if there are in the neighbourhood, where it is proposed to plant, women in sufficient number to gather the fruit, without importing them from a distance. In this village there are upwards of 200 women and girls employed during the season in fruit-gathering alone. In my case I usually have 60 tons of Gooseberries to gather, besides other fruits. One person will gather 2 cwt. of Gooseberries per day. The season for Gooseberry-picking being very short (we pick all green we possibly can) should induce planters to consider this question. The bushes being 5 feet apart, a row of Strawberries may be planted between them. Crown Bbb, as a green Gooseberry, makes the best price; but Whigham's Industry bears a better crop by 2 tons per acre, and it travels well when ripe. The best Apple for

market in this neighbourhood is Lane's Prince Albert. A batch of 150 trees, six years old, have grown 8 tons 15 cwt. of fruit this year. I have now 800 trees planted. The same number of Bramley's Seedling of the same age produced 1 cwt.; Eckliaville Seedling is next to Prince Albert. The fruit is rather soft, and requires careful packing, but it sells well. Stirling Castle has been nearly all killed by canker, and the same may be said of Warner's King. Lord Grosvener produces too many malformed fruits in this soil to pay. Cox's Orange Pippin is not profitable here. The growth and bearing of the variety Bismarck is not to my liking. *W. C. Smythe.*

**DOUGLAS FIR.**—In your issue of the 15th, you have published an article by Mr. A. C. Forbes, in which he recommends the planting of Douglas Fir in certain localities. He regrets, however, that a thousand plants of that species, of the smallest size, could not be obtained for less than £5. Permit me to inform you that I have, during the last six years sown every year 1 pound of Douglas Fir seed, by which means I have obtained regularly every year between 8000 and 10,000 plants. I have thus ascertained that it would pay to sell the plants (two years seed-bed and one-year transplanted), for 30s. a thousand, and if a demand by the hundred-thousand should spring up, it would be a profitable business to sell such plants for 25s. a thousand. If British nurserymen will not sell Douglas plants at reasonable prices, I should advise proprietors to raise the plants themselves. *W. Schlich, Cooper's Hill, Englefield Green.*

**SEED POTATO BOXES.**—Messrs. Johnson's Potato-box, figured at p. 177, whilst no doubt capable of holding fully a bushel of seed tubers, seems to have two demerits. When taken in these boxes to the field for planting, it is evident that the tubers with their advanced growths must be removed from the boxes into baskets for planting, very much to the danger of the shoots already formed, and which it is the chief object of this form of storing to save. Then because the boxes have double floors, the lower tubers have to be taken out with exceeding care, or otherwise the shoots will specially suffer. One of the chief needs in connection with boxes of this kind is that they be very portable and useful as baskets to plant the seed tubers from direct, as well as for storing them. I have in the County Buildings at Kingston, a very large quantity of selected seed tubers in 194 diverse quantities, stored in 130 shallow seed-boxes. These are all of one exact size; inside measurement 15 inches by 13 inches, and 5 inches deep. They have stout  $\frac{3}{4}$ -inch ends, and strips  $\frac{1}{2}$ -inch thick each side and bottom, so that there is ample room for air to pass on the top. Lengthwise a stout strip of wood is let in to form a handle by which to carry the box. Each box will hold about 14 lb. of Potatoes. These boxes could be loaded on to a hand-barrow with the greatest facility, and to as great a number as could well be carried. They can, if store-room be scarce, be piled on top of each other to a great height. If not required for Potatoes, they do admirably for storing Apples or Pears in. Indeed, their uses are many, although the primary one is that of efficiently wintering Potato seed-tubers. *A. D.*

## SOCIETIES.

### WATERFORD HORTICULTURAL.

FEBRUARY 19.—The annual general meeting of this Society was held in the Town Hall, Waterford, on Wednesday evening, Mr. J. N. WHITE, J.P. (President), occupying the chair.

We take from the annual report the following points:—

“The committee reported that since the amalgamation of the Waterford Horticultural Society, at the beginning of last year, with the Waterford Amateur Gardeners' Society, the number of members has very largely increased, and now reached 189.”

The schedules of the summer and the autumn shows were revised, and the prizes won raised to a higher level, with the idea of attracting more exhibitors. This, we are glad to say, was responded to, especially in the gardeners' class.

In order to make the summer show as successful as possible, much expense was incurred by providing a large tent in the court-house grounds, in which the show was held, and in securing the services of a military band to attract the general public.

Unfortunately, the general election in the city clashed with the date of our show, which, together with the wet day, caused the receipts to be very much smaller than they otherwise would have been. The show itself, as regards number

and quality of exhibits, was admitted to have been one of the best ever held in Waterford.

The Autumn Show, held in the Town Hall, was well attended, and had the accommodation at our disposal been larger, the receipts would have been still higher.

Mr. Moore, of Glasnevin, spoke highly of this show, especially of the quality of the exhibits in the Chrysanthemum classes, some of which equalled those exhibited at Dublin a few days before.

They regret extremely the loss that the Society has sustained owing to the death of their noble patron, the Marquis of Waterford, who always took a lively interest in the welfare of our Society.

J. N. WHITE, Chairman.  
W. RICHARDSON, D. CANTWELL, Hon. Secs."

THE ACCOUNTS.

The statement of accounts showed that after the two shows of the previous year there was a debit balance of £14 1s. 7d., but that this deficit had been entirely wiped out by the generous response by many of the members to the circular appealing for aid. So liberal, indeed, had been the contributions for this purpose, that the entire sum realised amounted to £32 5s., which left a credit balance of £34s. 5d., with which to commence the new year.

Mr. Goff moved, and Mr. E. A. WHITE seconded, the adoption of the report and statement of accounts, which was carried unanimously.

On a discussion taking place as to the advisability of increasing the annual subscriptions of members, so as to preclude the possibility of the Society again falling into debt, and to enable it to carry on its work satisfactorily, it was resolved that a minimum subscription of 5s. be adopted.

ROYAL GARDENERS' ORPHAN FUND.

FEBRUARY 21.—The annual general meeting of the supporters of this charitable and excellent institution was held on the above date at Anderson's Hotel, Fleet Street, E.C., at 2 P.M. There was a good muster on the part of the members of the Executive Committee, but otherwise the attendance, though larger than on the occasion of the meeting last year, was nevertheless unsatisfactory. Such an attendance may point to an implicit confidence in the policy and management of the Executive Committee, but it is not calculated to maintain that activity amongst the supporters, so vital to the expansion of the institution. The chair was taken by W. Marshall, Esq. (chairman of the Executive Committee). The minutes of the last meeting having been duly read by the secretary (Mr. A. F. Barron), and adopted by the meeting, the chairman read the annual report, which is as follows:—

REPORT FOR THE YEAR ENDING DECEMBER 31, 1895.

The Executive Committee in presenting their eighth annual report, have again the pleasure of congratulating the subscribers to the Royal Gardeners' Orphan Fund on the closing of another successful financial year, and on the continued prosperity of the charity. The income derived from annual subscriptions still, however, gives the committee some anxiety, the past year's receipts again showing a slight decrease. The committee earnestly appeal to gardeners for a more generous support of the fund.

By the lamented death of the President, the Right Hon. Sir JULIAN GOLDSMID, Bart., M.P., the Royal Gardeners' Orphan Fund has lost a magnificent supporter, and his loss is deeply deplored by every friend of the charity. It is with the greatest satisfaction the committee are privileged to announce that His Grace the Duke of BEDFORD has been pleased to accept the Presidency of the Fund [His Grace's portrait will be found on p. 271, ED.]. The Committee have further to mourn the death of an old member of the executive committee in the person of Mr. JOHN WILLS, who was, from the establishment of the fund, one of its most generous supporters.

The committee have gratefully to acknowledge the receipt of £171 9s. from the "William Thomson Memorial" committee, being the proportion of the amount collected, which was voted to the Orphan Fund as a memorial of Mr. William Thomson, of Clovefords, a warm supporter of the charity, and a distinguished member of the gardening community. The right of voting in connection with this Memorial will be exercised by the Royal Caledonian Horticultural Society for fifteen years. The committee also most thankfully acknowledge the receipt of a legacy of £100 from Mr. George Taber; and one of £5 5s. from Mr. J. Taplin.

The annual festival dinner, which was presided over by Mr. Harry J. Veitch, proved specially satisfactory, the sum of £592 nett being thereby realised. A most cordial vote of thanks is hereby tendered to Mr. Veitch for his noble generosity to the charity at all times, and for his able advocacy of the claims of the fund on that occasion.

Since the foundation of the charity in 1887, in commemoration of Her Majesty's Jubilee, seventy orphan children have been elected to receive the benefits which it confers. Seven of these have been retired, owing to the age limit, and two from other causes, leaving sixty-one as the number of recipients at the end of the year, to which the committee recommend the election of ten more this day.

In addition to the payment of the regular allowances, applications were made during the year on behalf of some of the children retiring, for further assistance, according to rule XIII, and special grants have been made in three cases, amounting in all to £21, with the happiest results.

Mr. N. N. Sherwood, in addition to his generous support of the fund in the past, has very kindly undertaken to pay to the Royal Gardeners' Orphan Fund the sum of £13 a year in accordance with rule XII, for the maintenance of the child Frederick Barsos, as a memorial of the late Mrs. Emma Sherwood.

The members of the committee who retire by rotation are Messrs. Head, Laing, Nicholson, Osman, Poupart, Smith, Turner, and Walker, and all being eligible, they offer themselves for re-election, with the exception of Mr. Turner, who retires. Mr. Reynolds, Acton [Gunnersbury], is nominated to the vacancy caused by the death of Mr. John Wills; and Mr. J. Lyne, Foxbury Gardens, Chislehurst, in the place of Mr. H. Turner. Also the retiring auditor, Mr. M. Rowan, and the treasurer, Mr. T. B. Haywood, are again nominated.

The work in connection with the administration of the fund having greatly increased during the past few years, the committee have had the matter under consideration, and recommend that a paid secretary to the fund be appointed.

The committee recommend that Mr. A. F. Barron be the secretary of the fund, at an annual payment of 100 guineas.

CASH STATEMENT FOR THE YEAR ENDING DECEMBER 31, 1895.

Having inspected the Securities and examined the Books and Vouchers supplied to us, we hereby certify the above account to be correct.

(Signed) JOHN FRASER, Leyton } Auditors.  
M. ROWAN, Clapham }

Dated January 25, 1896.

The Chairman then referred in brief terms to the principal items in the report, and moved its adoption, which was afterwards seconded by Mr. Shephard. Mr. Alex. Dean asked if information could be given as to the number of voting papers returned. The Chairman said that information on the subject should be given after the counting had taken place. A short discussion took place on the question of Consols, Mr. H. J. Veitch thinking that the price of these was now so high that it would be well to dispose of them, and invest in new stock. After the report had been passed unanimously, the retiring Treasurer (L. B. Haywood, Esq.) was re-elected, and a vote of thanks passed for his past service. Mr. M. Rowan was re-elected auditor on the proposition of Mr. R. Dean, seconded by Mr. J. F. McLeod.

Mr. B. WYNNE then proposed that all of the retiring members of the executive committee be re-elected, with the exception of Mr. Harry Turner, who wished to retire. This was seconded by Mr. SHEPHARD, and carried. The two gentlemen nominated by the committee to fill the vacancies caused by the death of Mr. Jno. Wills and the retirement of Mr. Harry Turner were elected unanimously.

The CHAIRMAN then proposed that Mr. A. F. Barron be

asked to accept the sum of 100 guineas per annum for the discharge of the duties of secretary. Mr. MARSHALL said, that the Committee thought that although Mr. Barron had been hon. secretary for the past nine years, owing to changed conditions, the time had come when some slight payment ought to be made. He had visited Mr. Barron, and declared that, practically, the work necessitated the use of one of the rooms in the secretary's residence. Mr. Weeks seconded the proposition, which was supported by Mr. W. Roupell, who thought that it should be borne in mind that Mr. Barron had worked hard voluntarily for the past nine years. He also thought that a paid secretary was the best for such a fund, and that it would pay. Voluntary officers were very well for initiatory work, but such a Society could not always depend upon it. The Committee wished to treat Mr. Barron as a gentleman, and for that purpose the sum had been made guineas. Mr. A. Dean wished to know whether the 100 guineas would include the sum of £52 10s., which appeared in the report as payment to Secretary's clerk [The Chairman answered in the affirmative], and thought if that were so, the fact should have been indicated in the report. Whilst greatly in favour of voting the money to his friend, Mr. Barron, he (Mr. Dean) thought it would have been better to have presented it to him as an honorarium. The resolution was carried *nem. con.*, and Mr. Barron briefly returned thanks. An adjournment then took place for the counting of votes in the election of ten pensioners to the Fund, and Messrs. Poupart, Weeks, McLeod, and Bates, were appointed scrutineers.

On the resumption of the meeting, the ten successful candidates were declared as follows:—H. P. Smith, 482 votes; A. B. Ritchie, 475; S. Small, 389; F. A. H. Worth, 384; Blanche Dean, 325; Amy Farrant, 315; F. Pratt, 250; F. L. Haycock, 235; H. Anderson, 177; B. C. Stevens, 181. The names of the unsuccessful candidates were:—H. Rapley, who had 103 votes; W. Clark, 75 votes; and W. Wright (since dead), 79 votes. The number of voting papers sent out was 1300, and of these there were returned 828. Total number of votes, 2577. No voting papers were spoiled. Votes of thanks concluded the proceedings. In the evening a friendly dinner was held among members of the committee and friends.

NATIONAL CHRYSANTHEMUM.

FEBRUARY 24.—The annual general meeting of members took place at Anderson's Hotel, Fleet Street, on the above date, Mr. R. BALLANTINE, one of the Vice-Presidents, presiding, there being a large attendance of members. The notice convening the meeting having been read, together with the minutes of the last annual gathering, the Secretary, Mr. R. Dean, read the annual report of the committee, from which we make the following extracts.

An almost unprecedented growth of membership during the past twelve months, and the holding of four exhibitions of the highest merit, bear striking testimony to the great popularity of the Chrysanthemum. During the year ending December 31, thirteen Fellows and 149 Ordinary Members have been elected, and ten Societies admitted to affiliation. The number of Members retiring at the close of the year is smaller than usual.

In reference to the exhibitions, your committee greatly desire to see a larger representation of the early-flowering varieties at the September show, many new forms having been added to the section during the past few years. As in 1894, the October exhibition was of a very high order of merit. The November *fiets* was on a very grand scale, the ground floor and two spacious galleries scarcely sufficing to accommodate the numerous exhibits; the weather being happily most favourable. Your committee were gratified to notice a larger number of societies than usual contending for the Challenge Trophy. The late exhibition in December brought a charming display. Both the October and the December shows are undoubtedly growing in extent, quality, and attractiveness.

Your committee have amended their regulation as to the size of boards for Japanese blooms, and for the future in all classes in which this type is shown, the boards must be of the sizes set forth in the Special Regulations for Exhibitors.

The Floral Committee held ten meetings during the past year, and they were the means of bringing together an enormous number of novelties. Though great care is exercised in making awards to novelties, the general high excellence of the numerous new introductions required the awarding of a considerable number of Certificates of Merit. The Floral Committee have had under consideration their rules of procedure, and have amended them in several important particulars; one of these requiring that for the future three blooms of a variety must be shown to obtain a Certificate of Merit, though Commendations will be awarded to two blooms only, provided the variety possess sufficient merit.

In the present year the Society attains to the fiftieth year of its existence, having been originally known as the "Stoke Newington Chrysanthemum Society." Your committee have therefore made arrangements to celebrate the Jubilee of the Society in a fitting manner in November next, the carrying out of the same being entrusted to a Special Jubilee Subcommittee. The Catalogue Revision Committee are already at work compiling a Jubilee edition to date, for which it is confidently expected there will be a large demand.

The Jubilee Fund is yet considerably short of the sum required to enable the celebration as originally proposed to be carried out, and the committee make an earnest appeal to members to assist in making the Jubilee Festival a complete success.

The esteemed President, Sir E. Saunders, is most heartily thanked for his continued interest in the work of the Society, and the committee gratefully acknowledge his gift of a valuable

clock as a special prize at the November exhibition. They also thank the members and friends of the Society who generously gave special prizes at the November exhibition, all of which are greatly appreciated.

The financial statement discloses the facts that the receipts from all sources amounted to a sum of £919 9s. 5d., the expenditure, £854 1s. 9d.; balance in hand, £65 7s. 8d. The reserve fund, which at the beginning of the year stood at £55 2s., and which had been invested in the *Year Book for 1895*, was stated to be £45 11s. 8d., but payments for outstanding accounts had to be obtained which would cover any apparent loss. Still, the *Year Book*, which contained a mass of useful information, historical and otherwise, had not been taken by the member to the extent calculated upon, and it had been decided not to issue an edition in the early part of the present year. The secretary further stated that the financial position of the society was in every respect much better than at any time during the six years he had filled the office of secretary. The donations to the Jubilee Fund in cash amounted to £224 6s., inclusive of a special donation of £75 from the Royal Aquarium Society; special prizes in cash, £165 18s.; and plate and medals to £41 5s. As the total expenses for the Jubilee year would probably amount to £1200, there was yet need for further assistance from members, which he hoped would be forthcoming.

The Chairman, in moving the adoption of the report and financial statement, complimented the members on the satisfactory position of affairs, and urged upon them the necessity for supporting the Jubilee Fund, to enable the Jubilee Committee to carry out the celebration in all its entirety. The motion was seconded, and carried.

A hearty vote of thanks was passed to Mr. F. C. Ward and Mr. G. J. Ingram for auditing the accounts. Sir Edwin Saunders was re-elected President by acclamation, and a special resolution of thanks was passed in the same manner. The name of Mr. Harry J. Veitch was added to the vice-presidents, and Mr. J. R. Starling was re-elected treasurer; Mr. Brian Wynne as chairman of the general committee; Mr. T. W. Saunders as vice-chairman; Messrs. R. Dean and C. Harman Payne as secretaries; and Mr. H. J. Outbush as auditor in the place of T. C. Ward, who retired by rotation.

The following of the twelve outgoing members of the committee were re-elected—Messrs. H. J. Jones, G. Gordon, D. B. Crane, G. Stevens, E. Beckett, C. Gibson, W. Davey, and J. Wright; and Messrs. R. Ballantine, Norman Davis, H. Shoesmith, J. McKerchar, elected for the three years ensuing. Twelve candidates for membership were elected, the secretary reporting that there had been forty-two since the commencement of the year; and he further reported that twelve societies had been affiliated in the same period. Hearty votes of thanks were passed to the scrutineers, and to the chairman for presiding.

## NURSERY NOTES.

MESSRS. J. VEITCH AND SONS.

I HAD the pleasure of a conversation with Mr. J. Heal the other day at this nursery about his favourite plants, the hybrids of *Rhododendron multicolor* and *R. javanicum-jasminiflorum*. The crossing and intercrossing of these fine plants has become difficult to follow, notwithstanding one is helped a little by the different colours and forms of the flowers and trusses of the various seedlings. Here is a handsome seedling of Mrs. Heal, which has produced twenty-eight trusses, that is, a truss on the point of every growth, with the result that the energies of the plant are exhausted. The flowers are well formed, pure white, yet the seed parent is *R. multicolor*, a yellow variety; the pollen parent, *Princess Beatrice*, light yellow and pink. *Ruby* and *Neptune* are varieties which have rich-coloured flowers; the first-named a crimson, the latter crimson with a scarlet tinge. *Hercules*, I think, is one of the finest varieties as yet raised, and it had *R. Princess Frederick* as the seed parent, and *R. javanicum* the pollen parent. The flowers are of regular form, 3 inches in diameter; the segments of the corolla, six to eight, give a rounded outline to the bloom. The colour is a bright buff, of an orange shade. *R. Primrose* is of a canary-yellow colour. The pollen of the species *R. Leymanii* was employed upon the garden variety *R. Maiden's Blush*, to produce this, the finest yellow-coloured *Rhododendron* yet obtained. *Rhododendron* × *Eor*, shown under the name of *malayanum javanicum* at the February meeting of the Royal Horticultural Society, the result of a cross between these two specific forms and a garden hybrid, is a charming flower, of waxy texture, and bright rosy-red colour. It is an excellent blossom for use in making small coat-bouquets, &c.

The above varieties show the steady advance that has been made in recent years, and the gain in breaking away from the continual crossing and re-

crossing of the purely garden varieties by introducing the pollen of species such as *R. multicolor*, *R. Leymanii*, and the small-flowered *R. malayanum*. The results were not at first so pronounced, but now these are very apparent, and of a most satisfactory kind.

*Orchids*.—It is yet early for a large display, still a brave show is made at this nursery. Of course, the chief portion consists of *Cattleya Trianaei* in large variety, some with labellum of richest purple-crimson, others with more delicate shades prevailing in this portion of the flower, and others again with no trace of these colours. The delicate tints and fragrance of *C. Schroderae*, renders it the most desirable of *Cattleyas*. Passing through the large *Cattleya*-house, into the rock garden where Ferns and other greenery make a delightful contrast to the gay colours of the Orchids, some lovely *Epidendrum Andreisii-Wallianii* were remarked, a plant whose name reveals its parentage; the sepals and petals are deeply spotted purplish on a cream-ground; the lip is white, but singularly marked with lilac-purple. What a contrast to this one is *Lycaste fulvaceus*, the sepals and petals of a yellow hue, and lip of a bright orange colour. Many *Dendrobiums* are in flower, viz., *D. Wardianum*, *D. nobile* in many varieties; the brightest of the last-named being *D. n. nobilium*. *D. Schneiderianum*, a fine garden variety, rather uncommon, whose sepals and petals are white, flushed with rosy-purple at the tips, and lip with a large blotch of yellow. It is a *D. Fendlayianum* and *D. aureum* cross. *D. Alcippe* is another fine cross allied to *D. micans*; it has been obtained by crossing *D. litiflorum Freemanii* with *D. Wardianum*; a lengthy spike furnished with eighteen flowers was observed of this cross. The sepals and petals are of a deep rose-purple shade, and the *D. Wardianum* blood is apparent in the lip, which has a heavy purple-maroon blotch. *Oncoglossum ramosissimum* was in flower—a very pleasing variety, with white sepals and petals. This species is getting rare in gardens. I was interested in the success of a house set apart for the culture of *Dendrobiums* in baskets. I saw the plants growing therein in the summer of last year, and they were treated to temperature, atmospheric conditions, and shading such as I have often recommended. There is scarcely any shade employed in this house, and the plants are watered freely when growing. There is a long, shallow tank underneath them, which is edged with rough pieces of rock, and embellished with some of the choicest Ferns. The *Dendrobiums* have made splendid growths, which are studded with flower-buds, and as the plants come into flower they are removed into the show-house alluded to above. *J. D.*

MR. GEORGE MAY'S.

It seems inappropriate to apply the term "nursery" to such a floral establishment as that of Mr. George May, at Upper Teddington, Middlesex, because, with the exception of the now famous but most un-euphoniously named *Carnation*, *Uriah Pike*, few plants go out of the place. Practically, this huge area of glasshouses, which is being added to every year, produces flowers for cutting only. Just now, the primary subjects under culture are *Roses*, all in pots; as are *Carnations*, *Eucharis*, *Gardenias*, *Liliums*, and *Maidenhair Fern*. *Roses*, both *Tea* and hybrid perpetual, are here by tens of thousands; indeed, a sufficient number of plants is bought in every year to set up a nursery, and yet thousands of plants are from four to six years old. The most extensively grown of *Teas* is *Catherine Mermet*, a most beautiful variety, but rather shy with its beauty. Mr. May opens the door of a long span-house, and invites a look-in. We see a remarkable sight, for the house is 20 feet wide, and 265 feet long, literally full of plants in pots, 8 and 9-inch in diameter, the plants ranging from 4 to 5 feet in height. Really, the numbers seem countless, and all in perfect health, and wonderfully clean.

A little further on is a range in two houses of the same width, but 295 feet long, also full of the same *Rose*, but taller plants, mostly in 10-inch pots. It is a

wonderful sight, the culture being first-rate. Then we turn into a couple of broad span-houses, each 130 ft. long, just as full of *Niphetos*, the plants very strong, and from 5 to 6 feet in height, blooming freely. Of course, the blooms are cut over hard every day or two. Then there are *houssae*, long and wide and numerous, full of *La France*, *Baroness Rothschild*, and *General Jacqueminot*, that fine old crimson H.P., that for market forcing has not been excelled by any newer one. These are in varying stages, from those blooming to late plants just breaking in cool-houses.

Of *Carnations*, especially that fine crimson variety *Uriah Pike*, the numbers seem to reach up to some 100,000. They are represented further by *Winter Cheer*, the best scarlet, a pretty unnamed *Pink*, many seedlings, &c. The bulk of these immense quantities of plants are in 7-inch and 8-inch pots, and are very strong, producing blooms during the season in wonderful abundance.

After all, perhaps the most remarkable thing here is found in the huge collection of *Eucharis amazonica*. We see house after house crammed of plants, in pots ranging in diameter from 9 to 10 inches. There must be 5000 of these assuredly, and marvellously clean, robust, and healthy are they. Nothing is heard of the *Eucharis*-mite, which seems to have in the past seriously troubled those who may grow a few plants. The blooming period seems to be literally the year round, for if some plants be temporarily resting, others are blooming. It is not merely the number of plants which astonishes, but the wonderfully healthy condition everywhere visible. It would seem evident here, at least, that *Eucharis* culture is a very common-place business. One long, broad, span-house is full of climbing *Asparagus*, *A. plumosus* and *A. tenuissimus*. The growths are sustained by lengths of twine dependent from wires strained across under the roof. The plants are all in large pots, and throwing up shoots abundantly. There seems to be a large demand for this pretty decorative climbing material when in lengths of from 4 to 6 feet. There are also plants of *plumose nanus*, but the climbing forms are in most request. *Maidenhair Fern* seems present almost by the acre. The quantities in large pots, all stout, and making fronds strong and freely, run to several thousands. *Gardenias*, too, are very fine, all in bush form, in about 9-inch pots, clean, and set abundantly with buds. Of *Liliums*, at present the chief one is *Harrisii*, which forces so well, though Mr. May likes the ordinary longiflorum better. Then *L. Kreutzeri* is following in quantity for succession. There are immense quantities of the old *Double Daffodil* in pots blooming profusely, and myriads of pots of that and other varieties covered up out-of-doors. *Lilies* of the Valley in pots are full of flowers now, and myriads of crowns in clumps, and set singly into shallow boxes, within and without, for future blooming; so also of *Spiraea* clumps. *Arums* also are in huge quantities; indeed, there seems to be little limit to anything, even to the soil-heaps, which are small hills of several hundreds of loads. Naturally in such a place there is perpetual succession of flowering plants, and there is not an inch of waste space inside; indeed, the alleys are of the narrowest. Practically the place illustrates the remarkable ease—at least, apparently—with which market growers grow plants, and manufacture flowers. It presents a branch of horticulture that merits the study of every gardener. *A. D.*

WEST OF ENGLAND CHRYSANTHEMUM SOCIETY.—The annual meeting was held on January 8, 1896, under the presidency of the Right Hon. the Earl of Morley. The report and balance-sheet were read by Mr. C. Wilson, Hon. Sec. From this it appears that a very successful show was held, at which nearly £150 was paid in prizes. The society has now a balance of nearly £30. The Hon. Sec. was re-elected, Mr. DANERELL was elected Chairman of Committee, and Mr. GROOMBRIDGE Hon. Treasurer. The committee have made numerous alterations and additions in the local classes, especially those for fruits. There has also been a class added for lady subscribers for table decoration. The committee appeal for increased support for this important show.

Obituary.

MR. JOHN MORRIS.—Cultivators of the Auricula will learn with regret of the death of John Morris, of Dundee, which took place on the 15th inst., at the age of seventy-seven years.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns for DISTRICTS, TEMPERATURE (ACCUMULATED), RAINFALL, and BRIGHT SUN. Includes sub-columns for day-degrees and rainfall inches.

The districts indicated by number in the first column are the following—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c. Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W. 9, Ireland, N.; 10, Ireland, S. \* Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending February 22, is furnished from the Meteorological Office:—

"The weather was again dry and mild over the kingdom on most days, but some slight rain was experienced very generally about the middle of the period.

"The temperature was rather above the mean in all districts, but only just equalled it in 'England, E. S., and N.W.' and the 'Midland Counties,' and was slightly below it in 'England, N.E.' The highest of the maxima were registered on the 19th over England, but on irregular dates in Ireland and Scotland; they ranged from 58° in 'England, E.,' and 57° over the 'Midland Counties,' to 52° in 'Scotland, N.,' and 51° in 'England, N.E.' The lowest of the minima were recorded about the middle of the week, and varied from 22° in 'Scotland, E.,' and 23° in 'England, N.W.,' to 31° in 'Ireland, S.,' and to 3° in the 'Channel Islands.'"

"The rainfall was less than the mean in all parts of the kingdom, the deficit being greatest in 'Scotland, N., and W.' The bright sunshine was less than the normal very generally, the percentage of the possible duration ranging from 5 in 'Scotland, W.,' 8 in 'England, N.E.,' and 13 in 'England, N.W.,' to 24 in 'Ireland,' 25 in 'England, S.,' and 27 in the 'Channel Islands.'"

THE KEW HERBARIUM.—It is stated in our contemporary, the Journal of Horticulture, that the Herbarium at Kew has been enriched by recent presentations of specimens of new genera and species by Baron Sir Ferdinand von Mueller, a collection of 200 species by Dr. Haviland, a collection of dried plants by Mr. Elliott (an officer of the Indian Forestry Department), about 170 species of Californian plants, chiefly new species, by Mr. B. Davey, of Berkeley University; and a magnificent gift of nearly 1500 species of Central American plants by Mr. J. Donnell Smith.

MARKETS.

COVENT GARDEN, FEBRUARY 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. ED.]

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots such as Adiantum, Arum lilies, Aspidistra, Azalea, Cineraria, Cyclamen, Daffodils, Dracena, Erica, Evergreen Shrubs, Ferns, small, etc.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table listing prices for cut flowers including Arums, Azalea, Bouvardia, Carnations, Daffodils, double, Gerbera, Eucharis, Gardenias, Hyacinths, Lily of the Valley, Maidenhair Fern, Marguerite, Mignonette, Narcissus, White, French, 12 bunch, etc.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for various fruits such as Apples from Nova Scotia, Grapes, Gros Colmar, Nectarines, Pears, Pine-apples, Strawberries, etc.

VEGETABLES.—AVERAGE WHOLESALE PRICES.

Table listing prices for various vegetables including Asparagus, Mint, Mushrooms, Onions, Potatoes, Cauliflowers, Cucumbers, etc.

OLD POTATOS.

The few cold days since last report have caused more inquiries for all classes, and although prices show no advance, there is certainly a harder tendency.

NEW POTATOS.

Demand shows no improvement, and, if anything, prices are somewhat easier. J. B. Thomas.

SEEDS.

LONDON, Feb. 26.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report a quiet demand for field seeds. Meantime, prices all round of Clover and Grass seeds stand at the unusually low level, which proves this season so welcome to buyers. For French and English samples of Clover seed, the tendency is downwards. Full rates are asked for White and Alsyke. Trefoil and Rye grasses show no change. Tares find buyers on former terms. As regards Canary seed, bottom quotations have apparently been reached. Fine Hemp seed can now be bought for very little money. The wintry weather hardens quotations for Boiling Peas and Haricot Beans. There is no alteration this week in either Mustard or Rape seed. Some good feeding Dairies is now selling at attractively low rates. The Linseed trade is featureless.

FRUITS AND VEGETABLES.

BOROUGH: Feb. 25.—Quotations:—Savoys, 4s. to 5s. 6d. per tally; Sprouts 2s. to 2s. 6d. per bushel; Onions, 3s. 6d. to 4s. 6d. per bag; Carrots, 1s. 9d. to 2s. 3d.; and Turnips, 2s. to 2s. 6d. per dozen bunches; Horseradish, 8s. to 12s. per doz. bundles; Apples, 4s. 6d. to 6s. per bushel.

SPITALFIELDS, Feb. 25.—Quotations:—English Onions, 4s. 6d. to 5s. 6d. per bag; foreign do., 2s. 9d. to 3s. 3d. do.; Carrots, 2s. to 3s. 5s. per ton; horse do., 16s. to 20s. do.; Turnip-tops, 1s. 3d. to 1s. 9d. per bag; Broccoli, 1s. to 1s. 3d. d.s.; Greens, 1s. 9d. to 2s. 3d. per dozen bunches; Kale, 1s. to 1s. 2d. per bag; Savoys, 2s. 6d. per tally; Parsnips, 5d. to 7d. per score; Rhubarb, 1s. per dozen; Sprouts, 1s. 6d. per sieve; Parsley, 2d. per bunch; Celery, 8d. per roll of eight.

STRAFORD: Feb. 25.—The change in the weather has caused better clearances. Quotations:—Collards, 1s. to 2s. 6d. per tally; Savoys, 2s. to 4s. 6d. do.; Greens, 3d. to 1s. 3d. per bag; do., 6s. to 5s. 6d. per dozen bunches; Cauliflowers, 1s. to 2s. per dozen; do., 3s. 6d. to 9s. 6d. per tally; Carrots (household), 22s. to 33s. per ton; do., cattle feeding, 13s. to 24s. do.; Parsnips, 6d. to 9d. per score; Mangels, 12s. to 15s. per ton; Swedes, 15s. to 18s. do.; Onions, Dutch, 7s. 9d. to 3s. 3d. per bag; do. Bordeaux port, 5s. 6d. to 6s. per case; Apples, English cookers, 2s. to 5s. per bushel; do., dessert, 2s. to 5s. do.; do. Nova Scotian, 16s. to 20s. per barrel; Scotch Kale, 6d. to 8d. per bushel; Beetroot, 5d. to 8d. per dozen; Horseradish, 1s. to 1s. 3d. per bundle; Parsley, 1s. to 1s. 6d. per dozen bundles; Brussels Sprouts, 1s. to 1s. 3d. per half sieve; 1s. 9d. to 2s. 6d. per bushel; Rhubarb, forced, 1s. 4d. to 1s. 6d. per dozen bundles; Celery, 4d. to 1s. per roll; white Turnip, 1s. 6d. to 2s. 6d. per doz. bunches, and 20s. to 40s. per ton.

FARRINGTON: Feb. 27.—Quotations:—Savoys, 4s. per tally; Sprouts, 1s. 3d. per half-bushel; Turnip-tops, 1s. 6d. to 1s. 9d. per bag; Cauliflowers, 1s. 3d. to 1s. 6d. per dozen; Turnips, 2s. do.; Carrots, 2s. per dozen bunches; Celery, 2s. to 2s. 6d. per bundle; Leeks, 1s. per dozen; Rhubarb, 1s. 3d. do.; Apples, Greenings, 12s. to 15s. per barrel; Baldwin's, do.; Nonpareils, 14s. to 18s. do.; Tomatos, 1s. 4d. per tray; Grapes, black, 2s. 6d. to 3s. per lb.

POTATOS.

BOROUGH: Feb. 25.—Quotations ranged between 40s. to 90s. per ton.

STRAFORD: Feb. 25.—Quotations:—Dark-soil Bruses, 30s. to 35s.; do., light, 35s. to 55s.; Reading Glais, 35s. to 50s.; Sutton's Abundance, 40s. to 60s.; Scotch Main Crop, 70s. to 90s.; Magnums, 45s. to 60s. per ton.

SPITALFIELDS: Feb. 25.—Quotations:—Main Crop Kidneys, 60s. to 70s.; Scotch Magnums, 50s. to 55s.; Blackland Magnums, 35s. to 45s.; Sutton's Abundance, 60s. to 7s.; Danbar Regents, 70s. to 75s. per ton.

FARRINGTON: Feb. 27.—Quotations:—Saxons, 70s. to 60s.; Dunbar Main Crop, 70s. to 90s.; Bruses, 60s. to 80s.; Sutton's Abundance, 40s. to 60s.; Main Crop, 40s. to 60s.; Hebrons, 70s. to 80s.; Imperators, 30s. to 40s.; Magnums, 30s. to 40s. per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending February 22, and for the corresponding period last year:—1886: Wheat, 26s. 3d.; Barley, 21s. 10d.; Oats, 13s. 9d. 1895: Wheat 19s. 10d.; Barley, 22s. 2d.; Oats, 13s. 9d.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, best, 65s. to 87s.; inferior, 38s. to 60s.; hay, best, 60s. to 85s.; inferior, 30s. to 55s.; mixture, 65s. to 81s.; and straw, 20s. to 40s. per load.

MANURES FOR POT PLANTS.—At the Connecticut State Agricultural Station, American Gardening informs its readers "a large greenhouse is being erected to enlarge the study of the manorial requirements of crops grown under glass." This would seem to be precisely one of those matters which belongs properly to horticultural societies possessing gardens and houses, like the Royal Horticultural, which, with the facilities existing at Chiswick, and a new superintendent full of energy and go, it could readily carry out—at least, as regards all kinds of plants grown in pots under glass. Many gardeners, it is almost needless to say, do not know what manures are required by plants except empirically, or with the nature of the various manures they make use of. The consequence of this lack of knowledge are many shortcomings and failures in plant culture. They want to know the right kind of manure for certain classes of plants, and when and how to employ them. It would, of course, be necessary to secure the services of a chemist—not necessarily, as a permanent addition to the staff, but for occasional consultative purposes, and to make analyses of the plants grown under glass, where these are not already known.

**ERNST SICKENBERGER**, whose investigations of the flora of Egypt are well known, and who filled the Professorship of Chemistry, Pharmacology, and Botany in the Medical School at Cairo, died on December 8, 1895.

**BOOKS:** *H. F. T.* The more useful works, from a student's point of view, when he does not state what particular studies he wishes to take up, would be *Hemfrey's Elementary Course of Botany*, 4th edition (London: Van Nostrand, Paternoster Row); and *Text-book of Botany*, by S. H. Vines (London: Swan, Sonnenschein & Co.).

**CARNATIONS DESTROYED:** *McIntosh, Belfast.* The stems are bored by some kind of grub, but none was found in them. If you can catch some, kindly send them to us for determination. Its borings are like those caused by the Onion-fly.

**COLOURED ILLUSTRATIONS FOR GARDENING PERIODICALS:** *F. F. in P. Bohemia.* We should suppose that there are very few openings for the foreigner in this country, native talent alone being sufficient for our needs.

**CYCLAMEN FLOWERS:** *W. J. P.* The blooms are very large and "butterfly" like; and the plant from which they were taken must be a handsome one. We are much obliged by your kindly offer to send a photograph of it.

**EUCHARIS GRANDIFLORA BLOOM:** *J. T. L.* A case of fasciation or union of two flowers, as well as a leafy development of a segment of the perianth. It is not doubling in the proper sense, but a sign rather of redundant energy in the plant.

**FLORISTS' WORK:** *S. D.* There is no journal or periodical devoted to the cultivation of plants as it is pursued by the trade. Any good ordinary garden manual combined with, of course, some kind of garden practice, should afford all that you require.

**GALVANISED WIRE TRELLIS IN PEACH HOUSE:** *F. P.* The injury to the shoots may be averted by giving the wire two coats of oil paint, or by giving the bast two twists before passing it round a shoot when tying the trees to the trellis. By so doing the shoot is separated from the wire by a space of one-tenth of an inch. Bits of leather may be used under thick shoots and branches, to keep them from touching it.

**LILACS IN POTS:** *C. K. B.* Top dress or partially re-plant the plants, whichever may seem to be necessary, and if they have made any growth, do not put them outside before danger from frost is passed, but afford as much air as possible when there is no actual frost. If no growth has taken place, they may go outside without delay. All small, weakly shoots should be cut out, and generally, the remaining shoots should not be crowded, and some amount of selection ought to be made, cutting out at the base those removed, and shortening them back somewhat. The plants should be sunk in coal-ashes or gravel, or the soil only; in that case, the worms must be kept out somehow. The spot should be the sunniest there is in the garden. The plants may receive manure-water during June and July, but growth must not be made gross or unduly prolonged.

**MARKET CRESS:** *E. G.* Garden Cress (*Lepidium sativum*) is not commonly grown, but a form of it called Common Garden Cress, which has larger leaves, of a deeper green colour, and more abundantly produced. As cress is used in this country, the plant is not allowed to produce the true leaves, but is cut in the seed-leaf, when it is 1½ to 2 inches high. There is a golden-yellow Cress called "Australian Cress" in the trade, and you may have got this variety, but without seeing the plant (true leaves) we cannot say with certainty.

**MARKET VEGETABLES:** *Market Gardener.* We do not think you have so much knowledge of the subject as your signature would imply. All good varieties of the different kinds of vegetables in common use should be grown by market growers, but they are not grown, and generally it is only the heaviest cropping, largest, or most prolific, that find favour with them, excellence as regards shape or edible qualities finding but little consideration.

The really good varieties are seldom grown by the trade till years after their adoption by private growers. You would do well to inspect the various big markets, and make your own selection.

**NAMES OF FRUITS:** *Sherrington* Your Apples are much past their season, and not suitable for identification.—*A. Cockerell.* Apple, Annie Elizabeth.—*Mid-Kent.* Apple No. 1, New or Winter Hawthornden; No. 2, resembles Forge, but we are not quite sure of it.

**NAMES OF PLANTS:** *A. L.* 1, *Polypodium aureum*; 2, *Osmunda palustris*; 3, *Gymnogramma ochracea*; 4, *Nephridium molle*; 5, *Blechnum polyodioides*.—*H. G.* *Dendrobium barbatulum*.—*J. B., Guildford.* *Eria bracteacea*.—*W. J. P.* 1, *Dendrobium primum*; 2, *Nephrolepis exaltata*; 3, *Leucothoe spicata*; 4, send when in flower; 5, *Berberis nepalensis*; *Daphne Cœorum*.—*N. C.* 1, *Thuopsis dolabrata*; 2, *Cupressus glauca (sienensis)*.—*K. W.* 1, *Cryptomeria japonica*; 2, *Cupressus Lawsoniana* var.; 3, *Abies Nordmanniana*; 4, *Abies cephalonica*; 5, *Cupressus Nikaensis*, *alias Thuopsis borealis*; 6, a *Picea*, which cannot be identified from the foliage only.—*J. W. J.* A very good form of *Dendrobium nobile*. The *Narcissus* are 1, *N. incomparabilis cynosuroides*; 2, *N. princeps*.

**OIL STOVES IN GREENHOUSES:** *B. B.* No harm would be likely to accrue from using these means of affording heat in cold weather, if the products of combustion are allowed to escape—and a small hole in the highest point of the roof would secure this. If used in connection with some kind of hot-water apparatus, the heat would be more lasting, as well as beneficial to the plants than if oil-stoves alone were used.

**ORCHID FLOWER SENT IN A LETTER THROUGH THE POST:** *F. E. W.* As you are probably aware, the species of *Pleurothallis* are very difficult to determine—except a few, which are tolerably common. All that we found of your flower was a splash of purple colour, and a bit of dry tissue in the letter. Send specimen of flower and leaf in a small box with a little damp moss, and we will endeavour to identify it.

**POISONOUS PART OF THE LEAVES OF PRIMULA OROONICA:** *Welham.* The hairs are the parts which are capable of causing irritation to some persons. There is much irritation of skin, with minute pustules and redness.

**PRIMULA BLOOMS:** *J. W.* The colour is not exceptional, but the shade is a trifle uncommon.

**SPELLING OF NAME:** *J. M.* It is spelled Snowdon, after the Welch mountain of that name.

**VINE LEAVES:** *W. B. J.* The effect of deleterious fumes from sulphur or fumigation, probably. There are no evidences of insect agency or fungus. Such recently unfolded leaves on Vines under glass are very liable to injury from ammoniacal and sulphurous fumes.

**ZONAL PELARGONIUM CUTTINGS:** *Ignoramus.* The scabbiness seems to be a result of rough handling with grit on the hands when the skin of the cutting was very tender. The long cutting was placed too deep in the soil—a common cause of the loss of cuttings.

**COMMUNICATIONS RECEIVED.**—*H. Hastings.*—*J. B.*—*J. D. N.*—*R. Mahr.*—*Pope & Sons.*—*Ad Old Subscriber* (next week).—*P. W. W.*—*C. R. De la Salle.*—*W. B.*—*A. K. B.*—*W. L.*—*H. Hunter.*—*L. Maurer.*—*Hortus.*—*J. H. B.*—*H. B.*—*Chester Courant.*—*J. Mayne.*—*A. T. O.*—*Dr. R. W.*—*R. J. M.*—*J. O'B.*—*B. W. J.*—*McIntyre.*—*W. H. W.*—*A. D. W.*—*Attwood, Binsted & Co.*—*E. C. R. L. H.*—*H. D.*—*W. A. C.* (Carnation aower next week).

**SPECIMENS, PHOTOGRAPHS, ETC., RECEIVED WITH THANKS.**—*T. R.*—*H. C.*

**DIED.**—On February 23, at Eltham Court, Eltham, **RICHARD BLOXAM.**

**CONTINUED INCREASE** in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

**IMPORTANT TO ADVERTISERS.**—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

increased to the extent of more than 80 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

## THOMSON'S VINE AND PLANT MANURE.

The very best for all purposes. The result of many years' experience. Largely used both at home and abroad.

Agent for London:—**J. GEORGE**, 14, Redgrave Road, Putney, S.W.  
Agent for Channel Islands:—**J. H. PARSONS**, Market Place, Guernsey.  
Sole Makers:—**WM. THOMSON AND SONS, LTD.**, Tweed Vineyard, Clovenfords, N.B.

Price Lists and Testimonials on application. Analysis sent with orders of ½-cwt. and upwards.  
**SOLD BY ALL SEEDSMEN.**

## STANDEN'S MANURE.

ESTABLISHED OVER 30 YEARS.  
Exceeds all others in General Fertilising Properties and Staying Powers.

It promotes a rapid, healthy, and robust growth to plants generally.

It is a clean and dry powder, with very little smell. The highly-fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

## XL ALL LIQUID INSECTICIDE, (PATENT),

For Syringing, Dipping, and Washing Plants and Fruit Trees.

Manufactured in Bond, from pure Nicotine of Tobacco, by special permission of the Hon. Board of H.M. Customs.

**ADVANTAGES CLAIMED—**

It is always of uniform strength, and perfectly safe when used as directed. Kills every insect which affects Plants and Fruit Trees. Does not stain Foliage, Flowers, or Fruit. A clear Liquid (no sediment), herein differing from the crude, thick, soapy preparations frequently recommended. Being the Strongest in the Market, it is cheap in use, standing twice the amount of dilution of any other safe preparation. As an example, Kills Fly at 1 to 40 parts of water.

1 Pint, 2s.; 1 Quart, 3s. 6d.; ½-Gallon, 5s.; 1 Gallon, 10s.; also in 4 and 6-Gallon Drums.

To be had from all Nurserymen, Seedsmen, and Sundriesmen; or direct from the Manufacturer and Patentee—

# SPRING CAMPAIGN

## ATTACK ON THE PROVINCES.

NORTH, SOUTH, EAST, WEST. IN EVERY PART OF ENGLAND.

THE rapid strides made during the last few years in horticultural pursuits, and the constantly-increasing demand for Greenhouses (by which alone success in the perfection of floral beauty can be maintained) has induced Messrs. W. COOPER, Ltd., PIONEERS OF CHEAP GREENHOUSES FOR THE MILLION, to extend their operations in a way that will tend to encourage and further develop the art of floriculture in every part of England. THE FOLLOWING ADVANTAGEOUS TERMS ARE OFFERED FOR ONE MONTH ONLY:—

- 1.—All orders to be sent in before March 14, after which date no order will be booked below list prices.
- 2.—A deposit of 10 per cent. to accompany all orders, the balance to be paid to our foreman in charge of job upon completing erection, and price to be strictly Net.
- 3.—All houses will be complete as mentioned below, and painted two coats of good oil-colour at our works, and delivered free of any charge to your nearest station, erected and glazed complete.
- 4.—Customers to advise us immediately upon arrival of goods at their station by telegram, and to cart same, at their own expense, from station on to site, ready for erection, within 24 hours after arrival.
- 5.—Customers to have all ground cleared and level for our men to erect.
- 6.—Our men erect and glaze house complete and ready for use, free of any charge outside prime cost of house.
- 7.—We do not bind ourselves to erect on any particular date, which must be left entirely to us; but shall not exceed one month after date of arrival.
- 8.—We reserve to ourselves the right to refuse any order or orders that may be sent in upon these terms.

N.B.—Prices quoted for Heating Apparatus are only on condition that we supply the house as well; on no account could we deliver and fix Heating Apparatus at these prices without order for house, although we are prepared to fix houses without heating apparatus.

### AMATEUR SPAN-ROOF GREENHOUSE.

TENANT'S FIXTURE.

This Greenhouse is made especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but not expensive structure, and being constructed in complete sections.

The framework is substantially constructed of red deal, the lower part being filled in with good, sound, well-seasoned, tongued and grooved matchboards. The house is fitted with door, complete with rim-lock and brass furniture, painted two coats of good oil colour, supplied with all necessary ironwork end stages for each side, and good 16 oz. English-cut glass throughout.

Carefully packed and delivered carriage paid to nearest station, and erected complete, at the following respective prices:—

100ft. ...	10ft. ...	9ft. ...	5ft. 6in. ...	70 0 0

### THE AMATEUR FORCING-HOUSE.

TENANT'S FIXTURE.—SPAN-ROOF.

These Houses are offered at an exceedingly low rate, and should be readily approved by both amateur and professional gardeners, as brickwork, which is very expensive to a small house, is entirely dispensed with.

The utility of such a house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown.

Specification.—Framework substantially constructed of red deal; the whole of sides, and 2 ft. 6 in. of ends, boarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim-lock and brass-fittings, in one end; glass 16 oz. throughout, English cut. Ventilators supplied according to size of House, and stays necessary for opening same; stages for plants each side of House; all woodwork painted two coats of good oil paint, and the whole structure securely packed and delivered carriage paid to nearest station, and erected and glazed complete, at the following respective prices:—

Length.	Width.	Height.	Erected complete.	Length.	Width.	Height.	Erected complete.
7ft.	5ft.	7ft.	£4 0 0	15ft.	10ft.	8ft. 6in.	£11 0 0
8ft.	5ft.	7ft.	4 10 0	20ft.	10ft.	8ft.	14 0 0
9ft.	6ft.	7ft. 3in.	5 0 0	25ft.	10ft.	8ft.	19 0 0
10ft.	7ft.	7ft. 6in.	6 5 0	30ft.	10ft.	8ft.	38 0 0
12ft.	8ft.	8ft.	7 10 0	100ft.	10ft.	8ft.	65 0 0

### SPAN-ROOF VILLA CONSERVATORY.

This House is adaptable for the lawn of a villa residence, being well and substantially built, constructed of the best materials, and artistically finished, with diagonal panels. The framework is composed of 2 in. by 3 1/2 in. red deal, the lower part doubly-lined with tongued and grooved matchboards, and the roof properly fitted with sashes, which facilitates fixing or removing of same without disturbing glass.

The house is fitted with a half-glass door, complete with rim-lock, brass-fittings, and key, and is supplied with lattice staging for each side, footpath the entire length of house; gutters, down-pipes, top and side ventilators, according to size, and necessary ironwork for opening same. All woodwork painted two coats of good oil-paint, glass cut to sizes, and all parts securely packed and delivered carriage paid to nearest station, and erected complete, at the following respective prices:—

Long.	Wide.	High.	To eaves.	Erected compl.	Long.	Wide.	High.	To eaves.	Erected compl.
7ft.	5ft.	7ft.	4ft.	£5 0 0	15ft.	8ft.	8ft. 6in.	5ft. 6in.	£15 10 0

GARDENERS AND OTHERS WANTING SITUATIONS.  
26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.  
Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.  
Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Offices for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

**TO FLORISTS**.—Situation wanted, by experienced young Lady. Well up in Wreaths, Crosses, Bouquets, &c. Could take charge of Shop. Highest references.—**VIOLA**, 41, Wellington Street, Strand, W.C.

**"MOTHER, I AM OUT OF SORTS."**—He who uttered these words was a strongly-built young fellow, with clean-cut, intelligent features, but a glance was enough to show that he was run down by work and worry; his head was heavy, his eyes lacked brightness, he was languid, and the fiend of indigestion had printed its marks upon his face. "My boy," replied the good and wise mother, "be advised this once by me: let me doctor you." The lad readily assented, and in a trice **HOLLOWAY'S** world-famed **PILLS** were produced. They soon did their work, and in a day or two the young fellow went about his work like a new man filled with strength and energy.

WATER SUPPLY!! — WATER SUPPLY!!!

SEND FOR ILLUSTRATED LIST, No. 27, OF

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

FOR RAISING WATER for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from 300 to 400,000 gallons per day. Will force to a height of 800 feet.

FIG. A.—This ram lifts part of the same water that works it. (Engraved from Photo. of Ram which raises 250,000 gallons per day of 24 hours to medium height, with good, working fall.)

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring and forcing it to a small reservoir on the hill, at an elevation of 532 ft., and a distance of one mile, from which reservoir the water is gravitated for fire-extinguishing and general requirements of mansion, stables, farm, and village.

FIG. B.—This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS.

From T. FERNYHOUGH, Esq., Agent to the RIGHT HON. LORD HINDLIP, Braley, Ashbourne, Derby.

DEAR SIR,— Referring to the two Patent "B" Rams you started six months ago for the Right Hon. Lord Hindlip, on the Alsop-en-le-Dale Estate, I am glad to congratulate you on the success of your attempt to raise the necessary supply of water under conditions so difficult, the height to raise the water being more than 63 times that of the working fall. The Rams are worked by water from the River Dove, with the small working fall of 8 ft. 3 ins., and issuing from the rocky bank close by is a copious stream of pure spring water, 8000 gallons per day of which the Rams force to a reservoir three-quarters of a mile distant, and at the extraordinary height of 523 1/2 ft. above the Rams. The water is then gravitated from the reservoir to the several farms and houses on the estate, giving an ample supply to each, and still leaving a good overflow at the reservoir.

I am glad to add that the Rams lift more water than you promised, and seem to work with great ease and smoothness, notwithstanding the great elevation they force to.—Yours faithfully, T. FERNYHOUGH.

From the RIGHT HON. THE EARL OF HARROWBY, 44, Grosvenor Square, London.

SIR,— I have pleasure in stating that the two Hydraulic Rams which you supplied and fixed for me last autumn, at Sandon, have proved so far most successful, and that the work gives every promise of durability, whilst the economy, compared with the former much smaller and intermittent supply by steam-pump, will be considerable.

With a fall of about 14 ft. from a previously-existing mill-pool, the Rams supply reservoirs 168 ft. above the brook whence the water is forced, through pipes 1 1/2 miles in length. They sent up, as long as I required it, about 41,000 gallons per day. I now generally work the two Rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.—I am, Sir, your very obedient servant, HARROWBY.

From T. DYNE STEEL, Esq., M.Inst.C.E., Past President South Wales Inst. of Engineers, Bank Chambers, Newport, Mon.

DEAR SIR,—

In September of last year I applied to you for a Hydraulic Ram for the purposes of the Usk Waterworks, to be capable of raising 27,000 gallons per day, a height of 127 ft., with a working fall of driving water of 27 ft., and on your guaranteeing that performance, I gave you an order for the Ram. The machine you supplied has now been put to work, and I have much satisfaction in saying that it far and away exceeds in its performance my most sanguine expectations, and possibly yours also. I have just completed a series of exhaustive tests, with the following results:—Working fall of driving water, 30 ft.; vertical height raised, 127 ft.; length of rising main, 850 ft., from Ram to outflow; length of supply pipe 200 ft.; gallons per hour raised, 1,812; driving water used per hour, 8,188 gallons, showing the remarkable and gratifying result of 83 per cent. of efficiency. The tests were carefully made and repeated, the water measured and levels properly taken. Several trials were made, and I shall be glad to give any engineer interested in the subject facilities for repeating the tests at the spot. I may here state that for the rising main I used a large diameter of pipe, in order to reduce friction, with excellent effect.—Yours faithfully, T. DYNE STEEL.

USK WATERWORKS.

April 24, 1891.

From MARTIN CURTLER, Esq., Agent to the Right Hon. LADY NORTHWICK, Sansome Place, Worcester.

DEAR SIR,—

I have great pleasure in informing you that the Hydraulic Ram which you put in for the Right Hon. Lady Northwick, at Northwick Park, last year, has worked, and is working, most satisfactorily. The water, as you know, had to be raised to the height of nearly 400 ft., with 1,900 yards of rising main pipe, to a large tank on the top of a hill, in order to supply several farms on the estate with water for gravitation.

The supply to the tank is most ample, and there is an adequate overflow left below the Ram. Altogether the work is a very great success.—Yours faithfully, MARTIN CURTLER.

JOHN BLAKE, Oxford Street Works, ACCRINGTON, LANCASHIRE

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

**ASTER AND STOCK SEED.**—It is much to be regretted that every lover of the above have not afforded themselves the pleasure of seeing, and making an inspection, of our acres of these when in their full beauty; we give the assurance that all we have grown during the past eight years have been from our own Eynsford saved seed. Our new variety of Aster, Eynsford Yellow, is acknowledged a great acquisition. We ask all interested in these glorious flowers to send for our Catalogue containing full particulars of these and all other kinds of flowers of equally superior quality. Post-free.

H. CANNELL AND SONS, Swanley, Kent.

**SUCCESSFUL GARDENING.**—If you wish success in keeping a Garden, or as a Competitor, procure a copy of Dobbie's Catalogue and Competitors' Guide, 180 pages, Illustrated. Full Cultural Directions for Flowers and Vegetables. The Book free by Parcel Post for 6d.

DOBIE AND CO., Seed Growers to the Queen, Rothessy.

Demy quarto, printed on fine paper in grey, gilt top. Price, £1 11s. 6d.

**THE ART AND PRACTICE OF LANDSCAPE GARDENING.** By H. E. MILNER, A.M.I.C.E., F.L.S. With Etched Illustrations and Hand-coloured Plans. To be obtained from the Author, 7, Victoria Street, S.W.; or, from the Publishers, SIMPKIN MARSHALL & CO., Ltd.

**CHRYSANTHEMUM CUTTINGS.**—Madame Carnot, Chas. Davis, Madame Therese Rey, and others, 3s. per dozen, free.

W. CAVILL, Penally, R.S.O., Pembrokehire.

**SUTTON'S SUPERB SINGLE CINERARIA.**  
—Every year we receive numerous letters from customers, expressing astonishment and delight at the immense size, splendour and variety of colouring, symmetrical form, and profusion of flowers, borne by plants of our superb strain. Per packet, mixed colours, 2s. 6d. and 5s. post-free.

**SUTTON'S SUPERB SINGLE CINERARIA.**  
—"Your Cinerarias are magnificent—simply perfection. I have many flowers measuring 4 inches across, and an endless variety of the most charming colours."—Mr. John Thorp, Gardener to Mrs. H. B. Dunlop.

SUTTON'S SEEDS GENUINE ONLY DIRECT FROM SUTTON AND SONS, THE ROYAL SEEDSMEN, READING.

**NOW IS THE TIME TO PLANT PÆONIES, DELPHINIUMS, AND GLADIOLI.** Catalogue of KELWAY AND SON, Langport, Somerset.

**CHOICE GERMAN FLOWER AND VEGETABLE SEEDS.** CATALOGUES free on application. FRED. REMER, Seed Grower, Quedlinburg, Germany.

**LARGE PALMS & DECORATIVE PLANTS.** Immense Stock. All sizes up to 20 feet for Sale or Hire. Inspection Invited. Prices on Application. B. S. WILLIAMS AND SON, Victoria and Paradise Nurseries, Upper Holloway, London, N.

**TOMATO PLANTS, Chemin Rouge, strong plants, showing flower bracts in 60's, 20s. per 100; smaller plants, fit for planting out in 60's, 16s. per 100.** W. WHITELEY, The Nurseries, Hillingdon Heath, Uxbridge.

**GLOXINIA "AIGBURTH CRIMSON."**—Matchless vivid crimson self variety, of great size, finest form and substance; reproduced quite true from seeds—the most brilliant variety ever raised. 9100 ASPIDISTRA LURIDA or Viridis Leaves, 125 Bushels RHAPIS HUMILIS, 29 FLABELLIFORMIS.

IMPORTATIONS OF PALM SEEDS,

(To be sold at Four o'Clock.)

- Comprising:— 393,100 KENTIA BELMOREANA, 251,300 FORSTERIANA, 1400 CANTERBURYANA, 90,000 ABECA BAUERII, 40,000 PHENIX REOLINATA, 50,000 RUPICOLA.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, March 11, at Twelve o'Clock. On view morning of Sale, and Catalogues had.

Friday Next, March 13.

By order of Messrs. F. Sander & Co., St. Albans. CYPRIPEDIUM SANDERÆ (provisionally named), a grand importation of 1000 plants, in magnificent order and condition. The grandest Cypripedium for cutting purposes ever introduced. Flowers of great size. Dorsal sepal broadly spear-shaped, the basal portion and veins crimson-maroon, central portion yellow, shaded with green; the remainder pure white. Upper half of each lateral petal crimson-maroon, lower half clear yellow. The pouch is unique in shape, yellow shading into ochre. See drawing on view day of Sale, made by my own artist from Collector's description and photographs.

1000 Plants of CATTLEYA LABIATA VERA, Sander's unapproachable type. See description and extract from Collector's letter in reference to this new and superb importation of over 1000 plants of the grandest of all types from the hitherto unknown woods of Mount Anna. Plants are in simply perfect condition, and are finer than any before introduced into Europe.

The above are two of the most useful and beautiful Orchids known for cutting purposes. Also MILTONIA SPECTABILIS VAR. MORELIANA, the dark, large flowered atrobens type, in superb masses. Condition simply perfect.

DENDROBIUM WARDIANUM GIGANTEUM, the gigantic, richly-coloured, Upper Burmese type—the finest of all; unequalled for size and brilliancy of the flowers.

We shall also include in this Sale, a new importation of a large number of plants of our celebrated and magnificent LANG TANG variety of Dendrobium nobile, just to hand in finest order.

HABENARIA SUSANNE, a beautiful snow-white flowered Orchid, awarded a First-class Certificate Aug. 28, 1892.

ONCIDIUM VARICOSUM ROGERII, DENDROBIUM FINDLEYANUM, a grand Orchid for cutting purposes.

VANDA CERULEA.—From the district which has yielded the finest forms. DENDRODIUM ANOSMUM DAYANUM.—A splendid Dendrobe, plants in fine order.

VANDA HOOKERIANA GIGANTEA.—Flowers very large, white, rose and amethyst-purple. Also 20 PLANTS of ANGULO CLOWESII. The large yellow-flowered scented Cradle Orchid, now seldom imported, &c.

Also a fine specimen of CATTLEYA TRIANA ALBA (guaranteed true), either in bud or flower; with 22 bulbs and several leads (another property).

TO BE SOLD BY AUCTION BY

MESSRS. PROTHEROE AND MORRIS at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, March 13, at half-past 12 o'Clock. On view morning of Sale, and Catalogues had.

The Green Bank (Sheffield) Collection of Established Orchids.

By order of Daniel Duncaster, Esq., of Green Bank, Sheffield, who is giving up his collection owing to going abroad.

MESSRS. PROTHEROE AND MORRIS are instructed to SELL the above by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY, March 18, at half-past 12 o'Clock precisely.

Amongst the plants will be found the following:—

- Cattleya Trianae albicans, Cypripedium, Borallistratum, Mendolii triumphans, Ptochocarpum superbum, Skinneri oculata, insigne, Sanderianum (true), Callyso, Canham, Charles Richman, Morganie, Doncasterianum, Volanteanum Lowii, Arthuriatum, Cythera, Dendrobium nobile Cooksonii, Enfieldense, dark variety, splendissimum grandiflorum, Rotschildianum, Harveyanum, Lælia Gouldiana, orphanum, aniceps Dawsonii, Lecanum giganteum, Oncidium bronchium, Statlerianum, 100 Odontoglossum Alexandrae, T. F. Hayward, many fine plants, Nisibe, and many other Cool-house Orchide, Sanderæ (true).

The plants will be on view morning of Sale. Catalogues may be had of Mr. J. Malcolm, Head Gardener, on the Premises, Green Bank, Sheffield, and of the Auctioneers, Valuers, and Estate Agents, 67 and 68, Cheapside, London, E.C.

Friday Next, March 13.

IMPORTANT SALE of HARDY PERENNIALS, Exhibition HOLLYHOCKS, PANSIES, IRIS, CYPRIPEDIUM SPECIABLE, LILIUMS in variety, ANEMONES, TIGRIDIAS, BEGONIAS, MONTBRETIAS, GLOXINIAS, DAHLIAS, CLEMATIS, TEA and other ROSES, CARNATIONS (new and old varieties), PINKS, PLOXES, Double and Single PÆONIES, AMARYLLIS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, March 13, at half-past 12 o'Clock. On view morning of Sale, and Catalogues had.

 PRICE LIST post-free on application to the Superintendent.

**NEW  
 CHRYSANTHEMUMS.**

I have much pleasure in drawing attention to the Five New Varieties I am sending out this season, raised by Mr. Chas. E. Shea, whose aim it has been to raise quality rather than quantity, and this is proved by the fact that Seven Varieties out of Nine of his raisings have received First-class Certificates. No other raiser, English or Continental, can show anything like this record. This speaks for itself, and the varieties I have much pleasure in offering will require no florid description to ensure them a good reception from every exhibitor.—

**LAXTON BROS., BEDFORD.**

**WHEELER'S ALDERMAN POTATO.**

For exhibition this Potato is a model, the eyes are shallow, the skin rough; it is of large size, a great cropper, and of the finest possible quality; it withstands disease well, and is one of the most profitable Potatoes to grow. The tubers will stand cutting freely.

Price 3s. per peck; 10s. 6d. per bushel (56 lb.).

In order to extend the knowledge of this valuable Potato, we will forward a sample of 2 lb. post free on receipt of one shilling.

I cannot speak too highly of your ALDERMAN POTATO. I had plenty of tubers 1½ lb. in weight, and they cooked very dry and white.—**W. H. FREETH.**

Your ALDERMAN POTATOS were very good indeed. I weighed one of the largest, and it turned the scale at 2 lb. 3 oz. I never had such Potatoes before.—**HY. MORGAN.**

Your ALDERMAN POTATO is a splendid one.—**MAJOR C. BROWNE.**

Last year's produce of the ALDERMAN POTATO was excellent. We are eating them now every day, and often remark their goodness.—**H. W. LIVETT.**

I am specially pleased with the ALDERMAN POTATO, and consider it one of the most valuable introductions.—**J. H. FRY.**

From 7 lb. of your ALDERMAN POTATOS I raised 3 cwt.; for size and cooking quality nothing can surpass them; many weighed 1½ lb. each, and one extra large one being 2 lb. 2 oz.—**JOHN CLUTTERBUCK.**

Numerous other testimonials, copy of which may be had gratis and post free on application.

# JAMES SENDALL & CO., LTD., MANUFACTURERS, CAMBRIDGE.

# HUMULUS LUPULUS

(PERENNIAL).

## The wonderful-flowering CLIMBER.

THE QUICKEST, HARDEST, AND PRETTIEST IN THE WORLD.

The "Bazaar, Exchange and Mart," Dec. 30, 1895, writes:—

"Most people seem fairly well acquainted with the economic uses to which the common Hop are put, but comparatively few seem to be aware of its value as an ornamental plant, or it would assuredly be oftener found in our gardens. Amateurs are frequently in need of a subject which will cover an unsightly fence, verandah, or what not, in a short space of time, and that will look fresh and green over a long period. Now all this and more they would find in the Hop (*Humulus lupulus*), as we know it in Kent and elsewhere. Its foliage is of a lovely green in early summer, changing gradually as autumn comes; while its graceful panicles of greenish-yellow flowers afford a pretty contrast. Not the least desirable of its many recommendations is its perennial character; for, when once planted, it seldom needs replenishing.

**ITS FIRST COST MAY THEREFORE BE SAID TO BE ITS LAST.**

"There are many objectionable spots in gardens that might be rendered at least pleasing to the eye by means of this plant, and those who have such may be glad to learn of the decorative qualities of the Hop. No particular soil is required to grow it, though a deepish loam is conducive to its well-being; but there is no need for the amateur to be deterred on account of soil.

"There is another species (*Japonica*) which is oftener seen in gardens than the one to which attention is directed; but my own preference is for our native plant, whose merits I consider deserve to be more widely known."

"Amateur Gardening" says:—"An interesting and decorative plant."

## PLANT HUMULUS LUPULUS AT ONCE.

*THIS YEAR will cover WALLS, FENCES, VERANDAHS, ARCHES, PORCHES, TRELIS-WORK, HOUSES, RUSTIC CORNERS, and UNSIGHTLY BUILDINGS of ANY DESCRIPTION.*

*Can climb 20 feet in one season, INCREASING YEARLY. Grows anywhere or anyhow, on wood, wire, or string.*

Six Plants (two named varieties), P.O. 3s., flowering August and September.

Twelve Plants (four named varieties), P.O. 4s. 6d., flowering August, September, and October.

**SPECIAL OFFER** { Thirty-six Plants (twelve named varieties), P.O. 10s., flowering in succession, July, August, September, and October.

Full instructions for Planting and Growing sent with every Order. All Plants Carriage Paid.

Invites an inspection from intending Planters to the following well-grown TREES, having stout, clean stems, with handsomely-furnished, well-balanced heads, and from frequently transplanting are splendidly rooted:—

- ACER DASYCARPUM, 14 to 20 feet.
- .. WIERII LACINIATUM, 10 to 14 feet.
- .. NEGUNDO VARIEGATA, Standards, 8 to 10 feet.
- .. REITENBACHII, 12 to 14 feet.
- .. SCHWEDLERII, 12 to 18 feet.
- .. WORLEVII, 12 to 14 feet.
- .. LEOPOLDII, 12 feet.
- BEECH, Purple, Pyramids, and Standards, 10 to 20 feet.
- BIRCH, Silver, 12 to 14 feet.
- ORANUS SEROTINA (American Bird Cherry), 12 to 16 feet.
- HESTONTS, Horse, 14 to 20 feet.
- .. Double White, 14 to 16 feet.
- .. Scarlet, 12 to 18 feet.
- .. Briotii, 10 to 16 feet.
- ELMS, English, 10 to 12 feet.
- LIMES, 12, 16 to 20 feet.

All our Limes are the best red-twigged variety.

- .. EUCHLOA or DASYSTILA, 12 to 14 feet.
- .. Silver-leaved (Tilia argentea), 12 to 14 feet.
- LIQUIDAMBAR, 6 to 10 feet.
- OAK, English, 12 to 14 feet.
- .. Scarlet American, 12 to 14 feet.
- POPLAR CANADENSIS NOVA (the true variety), 12 to 16 ft.
- SYCAMORE, Common, 12 to 17 feet.
- .. Purple, 14 to 16 feet.
- THORNS, Double Pink, 8 to 10 feet.
- .. Paul's Double Scarlet, 8 to 10 feet.
- .. Double White, 8 to 10 feet.

### WEeping TREES.

- BEECH, Weeping, Pyramids, and Standards, 8 to 12 feet.
- .. Weeping, Purple, Pyramids, and Standards, 7 to 12 feet.
- BIRCH, Young's Weeping, Pyramids, and Standards, 8 to 14 feet.
- .. Out-leaf Weeping, Pyramids, and Standards, 10 to 12 ft.
- ELMS, Weeping, Pyramids, and Standards, 7 to 14 feet.
- LARCH, Weeping, Pyramids, 8 to 10 feet.

SATURDAY, MARCH 7, 1896.

## BRITISH ROSES AND THEIR RAISERS.

FOR a long period after the appearance of the first hybrid perpetuals, France may be said to have possessed the monopoly of Rose-origination; but of late years her rosarians, of whom the more illustrious are Guillet, Verdier, Pernet-Ducher and Nabonnand, have found formidable competitors in the great British cultivators, and especially in such specialists as the late Mr. Henry Bennet, Mr. William Paul of Waltham, Mr. George Paul of Cheshunt, and Mr. Alexander Dickson, Jun., of Newtownards, in Ireland, who have given us many varieties of remarkable merit, too numerous to be fully characterized here. To an eminent Scottish firm, the Messrs. Cocker, of Aberdeen, we are indebted for Duke and Duchess of Fife, of which the latter is the more highly esteemed. A later production of the same cultivators is Duchess of York, which has, among other Roses in my garden, a very artistic and distinctive aspect. As it is, however, only semi-double, it is chiefly valuable for decorative purposes, rather than for exhibition. But this limitation, however great in the eyes of the ardent exhibitor, who is necessarily exacting, does not prevent it from being, if only on the ground of its exquisite colour, a genuine acquisition. The Messrs. Croll, of Dundee, who are among the foremost of our northern rosarians, and their rivals, Messrs. Thomas Smith, of Stranraer, in this county, have each succeeded in producing very interesting variations from Mrs. John Laing; which, however, have not yet been introduced. I hope to describe them on some future, and not far-distant, occasion.

Among the finest creations of the late Mr. Bennet, is that reigning queen of the hybrid perpetuals (so far at least as regards popularity) to which I have just referred; Viscountess Folkestone, one of the most fragrant of existing hybrid Teas—and a Rose that should be in every garden and rosary, however circumscribed; Grace Darling, much loved by the Dean of Rochester, with whom it is almost the first variety to bloom; and Princess of Wales, which is one of the loveliest of Tea Roses, and well worthy of its exalted name. From Mr. Bennet's Heinrich Schultheiss have been derived those Bedale and Cheshunt introductions, which are undoubtedly very valuable for beautiful complexion and early-flowering qualifications. I refer to Mrs. Harkness and Paul's Early Blush, which may be regarded as highly endowed English sisters, though the one was raised in Yorkshire, the other in Hertfordshire; their parentage being the same. The law of heredity, which, as a general rule, is not greatly admired by rosarians who aim at originality, is strongly manifested in these.

To Mr. George Paul we have to express our recognition of the merits of his Duke of Teck, a brilliant seedling from Duke of Edinburgh; brightness of Cheshunt, another lustrous Rose; Cheshunt Scarlet, a bright autumnal bloomer, but not very full; Charles Gater, a noble dark crimson, of velvety hue; Carmine Pillar, an acquisition almost rivalling Turner's Crimson Rambler in artistic effect; and Mrs. Paul, a magnificent Bourbon, remarkable alike for its colour, its fragrance, and majestic dimensions. It occupies a central position in my garden. Its companion is Spenser, a native of Waltham Cross, which has been expressively described by the Cheshunt rosarian as "a perfected Baroness Rothschild." It was raised by Mr. William Paul of Waltham Cross.

From Newtownards, in the co. Down, whose Mountains of Mourne I can see from this parish, have come some notable Roses, which have gained the highest honours that England could bestow. Among these the most impressive are Earl of Dufferin, Mrs. Sharman Crawford, an Irish beauty of great charm—one of the Messrs. Dicksons' finest introductions; Marchioness of Downshire, hardly less attractive, but here, at least, not equally prolific; Mrs. James Wilson, a Tea Rose of great substance, but somewhat difficult to open; Marchioness of Dufferin, whose extreme difficulty in expanding from bud to blossom, I have always regarded as a serious limitation in this temperate clime; Marchioness of Londonderry and Margaret Dickson, the former of which has been splendidly exhibited, especially by Mr. Frank Cant, of Colchester (who is, however, a consummate artist in this special direction); while the latter is a superbly decorative garden Rose. Mrs. J. W. Grant, recently Americanised by its present proprietors into "Belle Siebrecht," I have not yet added to my already almost sufficiently extensive collection of 170 distinct varieties; but I must do so ere long, as it bids fair to become, through the medium of unremitting and elaborate advertisement, the fashionable Rose. It is, I understand, a cross between La France and Lady Mary Fitzwilliam. With such a distinguished parentage, it can hardly fail to be imposing, and in any case it is certain to be very expensive. But we have this consolation—that its value in America will thereby be greatly increased.

Of the numerous hybrid Briar Roses originated by Lord Penzance, and introduced into cultivation by the enterprising firm of Keynes, Williams & Co., Salisbury, the most successful, in my opinion, are Amy Robsart, intended to commemorate the heroine of Scott's *Kenilworth*, and Lady Penzance. My only regret in connection with those Briars is, that though possessing very delicate and fascinating hues (with which Madame Adelina Patti recently told me she "had fallen quite in love")—they have not the fulness and endurance of the Persian Yellow, or Rosa Harrisoni. When grown in a long line with the Austrian Roses, and alternating with these, they are, as I can testify, marvellously effective; but like all summer Roses, they are a dream of tender beauty too bright to last. I hope his lordship's latest introductions, which have not yet produced such a sensation as their graceful predecessors, may prove somewhat more perpetual.

Mr. Benjamin R. Cant, of Colchester, a veteran rosarian, has been the raiser of a Rose of remarkable merit, viz., Prince Arthur, a luminous dark crimson, invaluable for exhibition purposes; while Mr. Prince of Oxford has given us the beautiful Tea Rose that bears his name.

From Mr. Cranston of Hereford we have received Sir Garnet Wolseley and the Crimson Bedder, which I cannot but deem precious for their brightness, fragrance, and productiveness. Mrs. Harry Turner and the Crimson Rambler have come to us from the Royal Nurseries, Slough; though one of these, popularised by those clever florists, Messrs. Harry and Arthur Turner, is of Japanese origin.

Mr. William Paul, of Waltham Cross, has probably produced a larger number of original Roses—many of these of the highest eminence—than any other living British rosarian. His first introduction of merit was Beauty of Waltham, derived from Jules Margottin; followed by the still more celebrated Duke of Edinburgh, which was raised by him at Cheshunt in 1868. The latter, as Mr. W. Paul once told me himself, was a derivation from the venerable General Jacquemont, and is, perhaps, the most famous of all existing Roses—a lofty distinction. Pride of Waltham, Crown Prince, Star of Waltham, Clio, and Duke of Albany have been acquisitions to the race of hybrid perpetuums. But Mr. Paul has also contributed very effectively to the Chinas, hybrid mosses, and Teas, as Corinna, Medea, Sappho, Zenobia, and Duke of York have sufficiently manifested; and Enchantress and Empress Alexandra of Russia, which I have had the privilege of seeing at Waltham, will, ere long, still more emphatically prove. Considering the extent of his efforts and achievements in widely-varying departments of horticulture—all of them necessitating incessant application—it is marvellous that Mr. Paul should have achieved so much and so honourably in the special direction of hybridisation. *David R. Williamson, Kirkmaitlan, Wigtownshire, N.B.*

## NEW OR NOTEWORTHY PLANTS.

### BOLBOPHYLLUM MULTIFLORUM.\*

GARDENERS are sometimes surprised to see their "genera" set aside by botanists who, without respect to sacred tradition, look only to the essential points of discrimination, the column and the lip. But even the most zealous defender of garden orchidology must admit that the little plant I have described once more, unites the character of a *Bolbophyllum* with those of a *Cirrhopetalum*. The creeping rhizome, the distanced, one-leaved bulbs, the yellowish-white flower-stalks, with their capitate flowers, are exactly as in *Cirrhopetalum*. The sepals are contracted from a very broad cordate base into narrow points; the petals are nearly the same as in all the other *Bolbophylla*; the lip contrasts by its dark colour with the yellowish-white sepals and petals, and has a white fringed border, which has a mealy look. The plant was described (not very accurately) and figured by Mr. Breda in Kuhl and Van Hasselt's *Genera and Species of Orchidaceous Plants*, t. 4, fig. 2, under the name of *Odontostylis multiflora*, Breda. The genus "*Odontostylis*" cannot be maintained, and undoubtedly has been many years united with *Bolbophyllum*. Mr. H. Ridley has overlooked this fact, and has described a *Bolbophyllum multiflorum* from

\* *Bolbophyllum multiflorum* (Breda), Krzl.—Caulis repente radicebus crebris sub ipsis caulibus in bulbum inornassatis secundariis; bulbis basi cataphyllis 2 altero majore altero maximo vestitis cylindricis subtrigonis, sulcatis 2.5 cm. altis, 5 mm. diametro monophyllis; folio oblongo lanceolato v. ovato-oblongo ad 5 cm. longo ad 1.5 cm. lato, firmo coriaceo; scapis strictis more *Cirrhopetalorum* capitatis quam bulbi paulum longioribus; bracteis ovaria aequantibus pellucidis acutis; sepalis 5 basi cordata coccinea longe productis linearibus; petalis naeis ovato-oblongis obtusis; labelli hypochilio lineari brevi, apichilio minuto oblongo margine alborinaceo, apice reflexo; gynostemio utriusque longe dentato. Flores vitellini 2-3 mm. diametro, labellum atratum. (*Odontostylis multiflora*, Breda, in Kuhl & Van Hasselt, *Gen. et Sp. Orchid.*, and Asclepiad. Favre (1827), t. 4, fig. 2.

Madagascar. According to the strict laws of botanical nomenclature, this latter name must be changed. The nomenclature of the two species should run as follows:—*Odontostylis multiflora*, Breda = *Bolbophyllum multiflorum*, Krzl.; *Bolbophyllum multiflorum*, Ridley = *Bolbophyllum Ridleyi*, Krzl. *F. Kränzlin.*

## ORCHID NOTES AND GLEANINGS.

### CYPRIPEDIUM VICTORIA MARIA.

In a Belgian note, which will be published next week, the resemblance of this species to *C. Chamberlainianum* will be pointed out. The last-named is, no doubt, a variable species, but *Victoria Maria* seems distinct in its glabrous, cream-coloured upper sepal, the nerves of which are green—in the more twisted lateral petals, which are of a dull purple colour, shining and destitute alike of hairs and of spots. The lip is more elongate, of duller colour, and quite destitute of spots. The staminode is very like that of *C. Chamberlainianum*, but less rhomboid, more elongate, acuminate even and green at the tip. We have not seen the foliage. The flower was sent to us by Messrs. Sander & Co.

### CATASETUM SCURRA.

A raceme of seventeen pretty white flowers delicately veined with green, which shows most attractively on the spreading side lobes of the lip, whose front is curiously bearded, comes from M. Chas. Maron, Orchid grower to M. L. Fournier, of Marseilles. The flowers well represent this rare and singular species, which was figured in the *Gardeners' Chronicle*, n. s., vii., p. 304, from a plant which flowered in Sir Trevor Lawrence's garden. The plant has again appeared, this time in the collection of botanical Orchids belonging to the Hon. Walter Rothschild, whose plant has a dark red base to the lip. In the variety flowered by M. Fournier, the colours of the base of the lip are yellow and orange, so there would appear to be variation in this particular in the different specimens noted. The species is a delightfully fragrant, and attractive curiosity.

### TRIGONIDIUM LATIFOLIUM.

This is a very singular and rare Orchid, with the habit of growth somewhat resembling that of *Maxillaria picta*, and with solitary flowers on slender wiry stems nearly 1 foot in height. At a distance, the flower resembles a small Iris in the regular arrangement of its three yellowish sepals, which are striped and tinged with purple; and the resemblance is still further enhanced by the erect, spatulate, yellowish-white petals, which are veined and heavily tipped with purple. The inconspicuous lip is green and yellow, and the plant when in flower forms a very elegant object. A specimen has been received from M. Louis Fournier, of Marseilles, in whose collection it has flowered; and the fine blooms of *Phalenopsis Schilleriana*, *P. Aphrodite* var. *Gloriosa*, and *P. leucorrhoda*, indicate that the beautiful moth Orchids, which puzzle so many growers, are doing well in the care of M. Chas. Maron, M. Fournier's Orchid-grower. *J. O'B.*

## METHODS OF PROPAGATION.

(Continued from p. 271.)

The Roses disposed of, we may now take evergreen subjects, as *Aucubas*, *Arbutus*, and the many handsome species and varieties of Holly, not forgetting the *Rhododendron*, though there are grave reasons for the latter being increased by layers.

The *Aucuba*, since R. Fortune introduced the male form from Japan (see *Gardeners' Chronicle*, April 27, p. 385, and August 10, p. 735, both in 1861), has greatly increased in favour and popularity, and there are many fine-foliaged varieties which the advanced gardener may desire to multiply. For this purpose select strong-growing green-foliaged seedlings for stocks, and pot them early in the autumn into 60's. Cut your scions from the plants you wish to increase, and lay-in by their heels till wanted. Early in January take one of these stocks, and cut it down

with a horizontal cut 2 inches from the level of the soil, and then split it down to the ground-line, taking care to avoid bruising the bark. Now cut your scion, which may be from 3 to 9 inches long, and form the base into a wedge by a slanting cut on either side; insert it into the split stock, and bind tightly with raffia, smear over with the clay mixture, or use grafting-wax, and plunge in the inside pit as directed for Roses. In about a fortnight the tie may be loosened, and the grafted plant brought out into the open pit, and in the spring it may either be potted into  $\frac{1}{2}$ -inch pots or planted

the high ground nearer London, is thought by Norden and other antiquaries to have been a Roman city, though others place the site upon the adjacent Brockley Hall. Aldenham finds but little mention in the older records; it lies within an easy walk from Watford, and is reached through pleasant lanes and fields. There are two main entrances to the park, one from Elstree and Edgware, and the other from Bushey and Aldenham. On approaching either, the visitor sees a stretch of land extending away in every direction, and in the centre, Aldenham House and its charming and well-

others—some of them denizens of the spots for many years. There is a broad lawn, and lofty Elms lining the roadway on either side, which reach to the main entrance on the Bushey approach, from which the mansion is distant about 200 yards.

The present mansion is a stately erection of red brick, dating from about the end of the seventeenth century; but several of the principal rooms are of the time of Charles I. Since it was occupied by the present owner, many important additions have been made, and the local chronicler further informs us that it has been inhabited for the past three cen-

FIG. 40.—VIEW IN THE GARDENS AT ALDENHAM HOUSE, ELSTREE.

out in nursery beds, taking care in both cases to let the soil cover the union, and make it firm around the roots. *Experience.*

(To be continued.)

### ALDENHAM HOUSE, ELSTREE, HERTS.

[ This fine residence, situated so thoroughly in the country, and yet so adjacent to London, stands in a park of about 200 acres. At one point it nearly or quite touches Elstree, and at the other the peaceful and picturesque village of Aldenham, from which the newly-created peer (H. H. Gibbs, Esq.), the owner of Aldenham House, takes his title. The village of Elstree, which occupies a commanding position on

wooded grounds. The local chronicler states that on entering the demesne from the main road leading from Edgware "the visitor becomes more and more impressed with an estate which stretches to the right and left, over a considerable area. About half-way along the drive a pretty rustic bridge spans an artificial lake, which under the genial influence of the sun, resembles a shining sheet of silver, and is an additional attraction to the beautiful grounds. On either side of the drive runs a row of fine young Chestnut trees, which, in years to come will form a grand avenue; there is also a velvety lawn extending right up to the mansion, effectively dotted with trees and shrubs." There are very fine examples of Elm, Oak, Ash, the silver Birch, representatives of the Fir tribe, and

travies by ancestors of the present family. The present noble owner takes the greatest interest in the garden and grounds, and is fully concerned in every alteration and improvement in them, the details of which he keenly follows; while his son, the Hon. Vicary Gibbs, the representative in Parliament of the St. Albans division of Herts, spends a considerable portion of his time on the estate and in the gardens, taking an intelligent interest in trees, of which he possesses a varied knowledge, and representatives of all those who do well in the locality find a place in the grounds. Within the past few years, an extension of the pleasure-grounds of some magnitude has been effected, something like 10 acres being incorporated, and laid out with taste and skill under the personal surveillance of Lord

Aldenham. Formerly a high road ran along by the side of the grounds towards Edgware from Aldenham and Bushey, and much nearer to the mansion than at present. When the extension of the grounds was determined upon, permission was obtained to alter the course of the road, one result being that the residence of Mr. Edw. Beckett, Lord Aldenham's head gardener, which was formerly on the opposite side of the road, is now included in the grounds. In carrying out the extension, which was done at considerable cost, a large number of labourers were employed, and every detail was executed with scrupulous care and close attention to effects. This extension has enormously added to the attraction of the grounds; and the laying out and planting of the same afforded excellent scope for the inventive skill of Lord Aldenham and his able gardener, and some most delightful features were introduced (see fig. 41).

To be fully appreciated, a visit should be made to Aldenham House in the height of the summer; or later on, at the end of August, when the beauty of full development has spread over tree and plant, when the green sward so admirably kept is seen to perfection; and the brilliant hues of multitudinous flowers light up the scene with a radiance peculiarly their own.

The gardens may be said to encircle the house, and with the pleasure-grounds they cover an extent of seventy-five acres. To attempt to describe in detail the new portion of the grounds would require considerable space; suffice it to say, that mounds were formed and planted with various shrubs and flowering plants, with glades of turf and winding walks intersecting them; and that all which is choice among evergreen and deciduous shrubs find a place here; and that the skill and resources of the landscape gardener have been so applied, that new features and delightful pictures meet the eye at every turn. Through it all runs an artificial water-course, obtained by bringing water from the reservoir at Elstree; the bottom of the stream is concreted, and there is provision for letting off the water at any time, and cleaning the bed. The skill of Mr. Pulham has been applied with great success in forming patches of rockwork at various points, and where it can be done, these are appropriately planted and furnished with relative subjects in plants and shrubs (see fig. 40).

The visitor, in passing along the right-hand side of the front entrance to the mansion, sees patches and panels of effective evergreens and beds of flowers; then through an archway, festooned with various creepers, a stretch of lawn is reached planted with large beds and panels of evergreens and flowering shrubs, such as *Rhus Cotinus*, *Corona sanguinea*, with its fire-coloured stalks, *Rosa rugosa*, &c., and at last the flower-garden is reached; encircling this garden is a handsome balustrading formed of red brick and terra-cotta, with vases at intervals.

The flower garden has undergone but little change in recent years; it is admirably planted, and always effective. Adjoining it is a huge bed of *Andromeda floribunda*, edged with *Erica carnea*, which must be an exquisite sight in spring; and near it is another bed of *Pernettya mucronata*. Here is an arched path, 62 yards in length, running towards the house, variously planted with appropriate climbers, *Aristolochia Siphon* being a prominent plant. Here also are beds of Japanese *Acer*, Golden-leaved *Privet*, *Berberis*, &c., all in keeping with the general plan of adornment.

On the north-east are the Rose and American Gardens, enclosed by an evergreen hedge, and a huge bed, with an angular front line was planted last summer with Oscar Wilde Sunflower, *Wigandia caracasana*, *Solanum* with ornamental leafage, *Brugmansia*, *Abutilon*, &c. In this respect Mr. Beckett introduces with much judgment some of the features of subtropical gardening which seem to fall into their proper places, and greatly enhance the general effect. A bed of fifteen plants of *Dracæna indivisa* was a commanding feature; succulents of the better sort also found a place here. *Heliotrope*, *Miss Nightingale* formed most pleasing beds; batches of *Ivy-leaved Pelargoniums*, *Calceolaria amplexicaule*,

*Grevillea robusta*, &c., were also to be found here; also *Malva arborea variegata*.

A Limetree-walk leads to the wilderness, a semi-wild spot, planted with various subjects, yet to be laid out in a fitting manner by forming grassy walks. In the distance can be seen the Shenley Hills. Next comes the "rootery," a spot in which roots of arboreal giants are utilised in working out various effects, with winding walks about them, many kinds of plants being utilised with considerable judgment.

Visitors to Aldenham House Gardens know that the fruit department is well maintained, and excellent results follow high culture. A new orchard has been formed which promises well for the future. Strawberries are somewhat extensively cultivated, the favourite varieties being *Vicomtesse Héricart de Thury*, *President*, *British Queen*, and *Sir J. Paxton*. *Stevens' Wonder* and other new sorts are under trial. *Vinerier*, *Peach-houses*, &c., are all in admirable condition. So are the plant-houses, in which there is a considerable variety of useful plants; cut flower and furnishing stuff abounding. Open-air plants for cut flowers are varied and numerous; one subject Mr. Beckett was growing largely was *Comos bipinnata* and its varieties, an excellent subject to cut late in the summer. *Dahlias*, and other summer and early autumn-flowering plants find a place; and such an expert with the *Chrysanthemum* as Mr. Beckett would not, of course, be without a well-selected collection of his favourite flower. As a grower and judge, he ranks high among gardeners who cultivate the golden flower.

And remembering the magnificent collection of vegetables Mr. Beckett produced some months ago at one of the meetings of the Royal Horticultural Society, it will not surprise anyone to know that the new kitchen garden of 2 acres produces them in the finest character. A many-sided man, he succeeds with every subject he takes in hand. A combination of intelligence, industry, and courage, he cannot fail to be in the front rank of his profession; as a servant, he enjoys the entire confidence of his employer. R. D.

## KEW NOTES.

*DIMORPHOTHECA ECKLONI*.—Seeds of this herbaceous shrub have lately been distributed from Kew, and as it does not appear to have ever been in cultivation before, the following particulars may be useful. It is said to be the handsomest of the twenty or so species found in South Africa. Mr. Galpin found it growing on grassy slopes at an altitude of 4000 feet in Barberton, where it was in flower in September and October. The flowers are 3 inches across, with deep, purplish red-ray florets, and a brown disc. It forms a strong half herbaceous bush about 2 feet high, freely branched, the branches erect, leafy; the leaves are narrow, spatulate, 3 inches long; the peduncles are 6 or 8 inches long, erect, with a solitary terminal flower-head like that of *D. nudicaulis*, the ray florets  $1\frac{1}{2}$  inches long. In the *Flora Capensis*, the ray florets are described as white above, purple beneath. The plant is likely to become useful for the greenhouse. Seeds of the plant have germinated freely at Kew.

### WELDENIA CANDIDA.

This pretty and interesting little plant improves under cultivation. It was introduced to Kew in 1894 from Guatemala, where it is known to occur only in the crater of the Volcan de Agua. It has a fleshy perennial rootstock, from which springs an annual stem 9 inches long and half an inch in diameter, bearing a cluster of spreading bright green leaves, 3 to 4 inches long, channeled, acuminate, with sheathing bases. The flowers are borne in a central capitulum, from which two or three at a time are developed; they have slender tubes, 2 inches long, divided at the top into three ovate, concave segments, forming a shallow cup, an inch in diameter, with the slender filaments and pale yellow anthers in the centre. The whole flower is of the purest white. The plant is something out of the common; it

flowers freely and continuously, and it is easily cultivated in a cold greenhouse along with *Diea*, *Primula imperialis*, &c. *Weldenia* is a monotypic genus of *Commelynaceæ*, and is a near ally of *Zebriua* and *Rhoeo*, both known in gardens as *Tradescantias*.

### MOREA ROBINSOONIANA.

The large specimen of this gigantic *Iris*, which has been a conspicuous feature in the succulent-house for the last ten years, and which flowered for the first time at Kew in 1891, is again pushing up numerous flower-spikes. The plant now spreads to a width of 9 feet, and the Phormium-like leaves are from 7 to 8 feet high. The position in which this plant stands, near the south doors, where there is abundance of air and all the sunlight possible, appears to suit it, and the drip from a frequently used water-tap, partly screened by its leaves, is no doubt to its liking. In 1891 the plant developed only three scapes, each 8 feet long, branched, and upon these were produced in succession 457 flowers, each about 4 inches in diameter, pure white, with a golden-yellow, crescent-shaped blotch at the base of three of the segments. The first flower opened on June 21, and the last on September 24. There were from twelve to eighteen flowers open at one time. This year there are a dozen or more spikes developing, so that the plant when at its best will probably be very fine. By some authorities this plant is known as *Iris Robinsoniana*.

### SENECIO BOURGÆI.

Plants of this species are now in flower in one of the greenhouses. It was first introduced to Kew from the Canary Islands in 1853, and a figure of it was published in the *Botanical Magazine*, t. 4994, under the name of *Doronicum Bourgæi*. It is a near ally of *S. cruenta*, the supposed parent of the garden *Cineraria*, but is easily distinguished from that plant by its leaves, which are pale green, with white wool on the under-surface, and by the petioles which have broad wings at the base, and several small ear-like lobes on each side, so that the leaf might almost be described as lyrate. The flowers are borne in large loose heads, as in *S. cruenta*, but they are larger, with a broader disc and fewer ray florets; their colour is bright purple. This species is worth growing for the decoration of the conservatory during the winter. It might also be useful to the breeder of *Cinerarias*; and it is probably an annual. We are indebted to the Cambridge Botanic Gardens for its re-introduction. [A figure of this plant will be shortly given in these pages. Eo.]

### ASARUM MAXIMUM.

This, the largest and handsomest of the twenty or so species known of this remarkable genus, is now flowering for the second time in the Begonia-house at Kew. It first flowered in March last year in the same house. This time the leaves are much larger, and they are so crowded upon the plant that the short-stalked flowers are completely hidden from view. The flowers, too, are larger and richer in colour than they were last year. Imagine a plant in a 6-inch pot with a cluster of cordate leaves very similar to the leaves of *Cyclamen persicum*, but three times as large. In a cluster at the base, and resting almost upon the soil, are the flowers, which are 2½ inches across, and of a rich maroon-purple colour, velvet-like, with a large three-lobed blotch of creamy-white in the centre of each. *A. macranthum*, *A. geophilum*, and *A. caudigerum* are also in flower in the same house. *A. maximum* is a native of Ichang, in Central China, where it was discovered by Dr. Henry. W. W.

## DENDROBIUM WARDIANUM AND OTHERS.

THE remarks in the *Gardeners' Chronicle* at p. 145 imply that some information on the cultivation of this type of *Dendrobium* may be useful. There are two distinct forms of this—perhaps the finest of all *Dendrobiums*. The Assam form was introduced so long ago as 1856, and flowered in March, 1858, in Messrs. Jackson's nursery at

Kingston. Sir W. J. Hooker figured it in the *Bot. Mag.*, t. 5058 as a variety of *D. Falconeri*, and not until another plant flowered in the hothouse of Dr. Ward, at Southampton, was it recognised as a distinct species. This variety was very scarce, and probably is so still, although it is most likely forgotten since Messrs. Low, of Clapton, introduced the Burmese variety in 1875. Some of the specimens from that importation were of immense size, and one of them was sold at Stevens' sale rooms, as imported, for 100 guineas; but Orchid fanciers soon found out that these very large specimens were past their prime, and that it was much more profitable

warmest house, where the temperature rises in the afternoon to 95° and 100°. I noted it once at 105°, but I do not care for the temperature to rise above 100° after the house has been shut up in the afternoon. The result of this great heat and humidity was very satisfactory, the plants making vigorous growth, some of the stems being 2 feet in length, and these are now studded with flower-buds. The plants require a moist house, and to be freely watered at the roots while growing; but when growth is completed, water must be gradually withheld, the plants taken into an intermediate-house for a week or ten days, and afterwards into a warm greenhouse,

is an admirable position for *Dendrobium* when at rest. I have tried them in various positions, and would choose the back wall of a lean-to house in preference to any other. When placed in the current of air from the front and top ventilators, they are liable to be injured; even plants in baskets are placed on the stage in preference to being suspended from the wires. The plants are taken from the cool-house to a warmer, moister atmosphere as they are required. A temperature of 50° to 55° is best to start with, and they do not need a higher temperature until the flowers have passed away. In fact, the blooms will last considerably longer in a

FIG. 41.—VIEW IN THE GARDENS OF ALDENHAM HOUSE, ELSTREE. (SEE P. 295.)

to purchase smaller and younger specimens. This distinct type of *D. Wardianum* has been suitably named Low's variety in compliment to its introducers, and it is this variety which is now found in general cultivation. I purchased some of the early-introduced plants, and still have some of them, but they now lack vigour; indeed, this is one of the faults of *D. Wardianum*, whether it be of the Assam or Burmese varieties. I bought two or three bundles of imported plants as late as May last year. They were apparently dried up, and looked as if they would take a year or two to recover their vigour. They were carefully planted in teak baskets, with the result that every plant made strong growth by the end of the season. They were grown in the

Two points are absolutely essential in the culture of these plants, which are a period of growth, and one of rest; and while at rest water may be entirely withheld, unless, indeed, the young growths show signs of shrivelling—but this must not be allowed to go on to any great extent, and it is wise to afford a small quantity of water occasionally so as to prevent it. I have a stage erected against the back wall of a late vinery, and here it is that my *Dendrobium*s are placed. There is heat enough to keep the temperature well above the freezing-point, and the air is kept dry and buoyant in order that the Grapes may keep well. For nearly thirty years I have worked on this principle, and find that the late vinery, even with the Grapes hanging and the leaves on the Vines,

greenhouse, even if the temperature falls below 45° to 50°. I have had handsome specimens of *D. Wardianum*, and also of *D. nobile*, in full beauty as late as the middle of June, which have been kept in the cool vinery aforesaid until the end of March. In this way a succession of bloom may be kept up from *D. Wardianum*, *D. crassinode*, *D. nobile*, *D. Ainsworthii*, *D. Leechianum*, and all varieties of the *D. Ainsworthii* type, for fully six months, beginning in January. Of course, a certain number of plants are taken into the warm-house at regular intervals, in the same way as other plants are forced; and the plants that flower earliest in one year also flower the earliest the year following. Of course, as soon as they pass out of bloom the plants are re-potted

should they need it, and they are immediately placed in the warmest house to make their growth, and naturally those that are placed in this house the earliest make their growth first, and pass out into a cooler house first, and thence into the lateinery again. All Dendrobes should, when making growth, stand near the roof of the glasshouse, and have ample space in which to grow. I place all my varieties of *D. Wardianum* near the glass roof in teak baskets—no sticks are allowed; but the growths hang over the sides of the baskets, and the points of the growing shoots are generally within a few laches of the roof glass. These growths, when the plants have rightly passed through the various stages of growth, been inured to a cooler temperature, and afforded a rest of not less than two months' duration, are usually found to be studded with blossoms for at least two-thirds of their length. As an illustration of a different course of treatment, I may mention that, some fifteen years ago, I bought twelve plants which had made their growth in small pots and stood crowded together on the stage of a span-roofed house. The young growths on some of the plants were 3 feet in length; but owing, I assume, to the distance at which they stood from the glass and being crowded together, few flowers were produced the following season. I had them turned out of their pots, and planted three or four together in baskets made of teak, and in these they made splendid flowering specimens the next year. It goes without saying, that all Orchids require a season of growth, and a season of rest, and the cultivator who hits upon the right periods for these will be the most successful with them.

In respect of *D. Wardianum*, it is well known to cultivators that the plants do not retain their constitutional vigour for many years. When a plant begins to decline it should be turned out of its basket or pot, and the dead and rotten roots and stale compost removed and be put into a new basket of a smaller size, using the best Orchid-peat and fresh sphagnum-moss in about equal portions. *D. nobile* and the crosses raised from it do not decline in vigour where in the case of the latter *D. nobile* is the seed-bearer, but a great deal depends upon following up a regular routine of culture, and in being very careful that the plants receive no material check during the time that they are growing. There are now many fine varieties of *D. nobile*, and the crosses in which this species is the seed parent are also very numerous. *D. Wardianum*, Low's variety, is being annually imported, and imported plants may be purchased from half-a-crown a-piece and upwards, so that there is not much need to fret about their decline in vigour after five or six years. *J. Douglas.*

## THE WEEK'S WORK.

### PLANTS UNDER GLASS.

By JNO. MCINTYRE, Gardener, Woodside, Darlington.

**STEPHANOTIS.**—Permanently planted out in the stove, the *Stephanotis* grows well and flowers freely four or five months during the year; but if grown on balloons for show purposes, the plant is not so easily managed. Those which have been rested and wintered in a cool end of the stove or intermediate-house, ought now to be given attention. Repot them if necessary into good loam two parts, peat one part, and some coarse silver-sand, adding some charcoal broken in pieces. Pot the plant firmly, then untie the shoots, and remove the balloon or stakes. If roof space is available, place the specimen at one end of the house, and run the shoots all their length along the roof, 4 or 5 inches from the glass, using ordinary twine in the place of wire. When growth has been made, and the plants are well set with flower-buds, take down the threads and train the shoots on balloons or stakes. Do this three or four weeks before they are wanted, in order that flower and foliage may regain their natural appearance. Care must be taken while they are growing on the roof to direct the young growths. Attention thus given simplifies their removal to the balloon or stakes. During growth, the specimens may be much benefited by frequent applications of Clay's fertilizer, or liquid manure from the farmyard.

**THE CONSERVATORY.**—Where the stock of plants is sufficiently varied and large, there need be little difficulty experienced in keeping the conservatory gay. Amongst hard-wooded plants are the Australian species of *Acacia*, which under cultivation of the simplest kind will flower abundantly. If these are pot-bound, as may readily be the case, farmyard liquid-manure applied frequently will do the plants much good. If planted out, a top-dressing of good loam and decayed manure in equal proportions is very suitable. One of the finest *Acacias* for a conservatory border is *A. Riceana*, a graceful plant when not in bloom, but at this season and later it is certainly one of the best roof, wall, or pillar plants in the conservatory. Established plants possessing pendent shoots 2 to 3 feet long, laden with their golden-yellow bead-like flowers are very fine objects, and the flowers make fine material for "sprays," and for filling tall flower-glasses. Most species of *Acacia* are handsome when in bloom, being very floriferous, and of bright shades of yellow. They delight in fibrous loam two parts, one part hard peat, and enough sharp sand as will render the peat and compost sufficiently porous. If grown in warm conservatories, the *Acacias* are subject to be infested by thrips and red-spider; and to kill the former fumigation two nights in succession with tobacco-paper is necessary, unless when in bloom, when fumigation must not be employed, as it causes the flowers to drop. Against red-spider use flowers-of-sulphur intimately mixed with soft-water, and applied with a syringe, the sulphur being allowed to remain on the plants two or three days before cleansing them with clean water and the syringe. Another good and showy flowering plant is *Cliveia miniata* in its many varieties, plants that are now showing very effective, gorgeous trusses of flowers. All the varieties are of robust habit, and should be potted in good loam two parts, leaf-mould and sand one part. Whilst growing, the plant requires abundance of water at the root. Specimens of *Cliveias* not yet showing flower, but wanted in April or May for show purposes, should be placed forthwith in gentle heat; and those now pushing into flower may be placed in a cold greenhouse to retard them.

**AZALEA INDICA.**—The principal part of the stock of plants which are to be forced should now be showing for flower. *Azaleas*, if required in full bloom in the month of April, may now be introduced into a temperature ranging from 50° to 55°, and be syringed night and morning. If the plants are infested ever so little by red-spider or white thrips, apply, by means of the syringe, Fowler's insecticide at the rate of 4 oz. to 1 gal. of soft-water at a temperature of 90°. The more effectually to get at all parts of the plants, they should be laid on their sides, and small plants should be dipped overhead in a large deep tub of this mixture. Pot-bound *Azaleas* well on their way for flowering, if healthy, will be much assisted if they are afforded occasional waterings with mild liquid-manure. Forced plants, after flowering, should have all the spent flowers and seed-vessels picked off, and be repotted if this be needed. I rarely repot *Azalea indica* more often than once in two years, and in the case of full-sized specimens once in three years. As a potting compost for specimens, peat two parts, loam and silver-sand one part each, will be found very suitable. *Azaleas*, if not wanted in flower before the month of May or June, should be kept as cool as possible, and if they can be put in a house facing north, so much the better. Later on, weather permitting, they may even be turned out-of-doors in a shady place, merely putting a glass eash or sashes over them.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

**FIG-TREES ON WALLS.**—Those trees which have been protected against frost may have the heavier portion of the protecting materials removed, and slighter protection afforded them for a short time longer, which will have the effect of gradually inuring the trees to the air, preparatory to being pruned and secured to the wall.

**THE FRUIT-ROOM.**—The fruit should be examined at frequent intervals, and those which show the least signs of rotting removed. Make note of the varieties that appear most suited to the locality, especially as to their flavour if dessert fruits, cooking quality if culinary, and the keeping qualities of all; making note of any varieties which may have become shrivelled by being immature when gathered, so as to avoid the mistake in the future.

**STRAWBERRIES.**—If the formation of new beds with the plants that have been forced is contem-

plated, the ground, weather permitting, should be trenched two spits deep, but keeping the lower spit in its place, mixing with it rotten manure if the soil is light; but if retentive, some that is partially rotted, in addition to old mortar, plaster, &c., road scrapings, and charred garden-refuse. The surface should be left rough as dug till planting is done.

**STANDARD TREES.**—Young specimens which were planted a year or two ago, when the necessary pruning is finished, should be fastened anew to their stakes, washing that part of the stem which was beneath the bands with soft-soap and water, to which a wineglassful of petroleum is added to each gallon. This will destroy any insects which may be hidden there. Do not use again any of the old tying materials, unless after dipping them in boiling water. The branches should be closely examined for American-blight, and if any be discovered the same mixture should be worked into the crevices of the bark with a stiff bristle brush. It will often happen that badly infested trees have the American-blight aphid on their roots, and it is always advisable to examine the roots by carefully uncovering them, and if the aphid be found there, the lower parts of the stem, and the larger roots should be washed with soap and water, and the soil about the roots drenched with the same, removing most of the soil and replacing it with fresh loam. No harm, but much good, will also be done by affording the soil a good soaking of gas-water, diluted with six times its bulk of clean water, which will be strong enough to destroy any of the insects it may come in contact with.

### THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorset.

**CHYSIS.**—The following epiphytal Orchids, *C. aurea*, *C. bracteata*, *C. laevis*, *C. Linnigheij*, and the distinct hybrid *C. Cheloni* are now fast developing their flower-spikes and young breaks, and will require more generous treatment in every respect. The plants must not be disturbed at the roots until after the flowers fade, when they will again emit new roots. At such time, afford plenty of drainage, and use a mixture composed of two-thirds sphagnum-moss and one of fibrous peat. During the summer, suspend the plants close to the glass in a shady corner of the Cattleya-house. Immediately the young leaves commence to unfold, they should be examined every day for small yellow thrips, for if these insects obtain a footing low down in the growths, it is exceedingly difficult to eradicate them, and the plants often refuse to make any further progress.

**CATTELEYA GIGAS AND C. WARNERI** will now be starting into growth; they should be placed at the warmest end of the house, and be afforded every encouragement until the flowers appear and growth is completed. The best time for repotting them is immediately the roots are seen pushing from the base of the new pseudo-bulbs, which is usually soon after their blooms fade.

**PACHYSTOMA THOMPSONIANUM** is a very pretty and interesting Orchid when in bloom. Being of West African origin, and from a moderately low elevation, it requires the hottest division. It succeeds admirably when grown in a small shallow pan, and suspended close to the roof-glass in the Cattleya-house. It is now commencing to grow, and if necessary, the plant may be given fresh material to root into. The pan should be half-filled with drainage, and use made of a compost of fibry loam, peat, and moss in equal proportions. When potting, keep the base of the bulbs just on the surface of the compost. When in full growth, the plant must be well watered each time it becomes dry, but carefully avoid keeping the soil in a saturated condition, or the small bulbs will decay. The species may be successfully propagated in the following manner:—If the plant is in good health, and there is no necessity for root disturbance, partially sever the rhizome between each of the old pseudo-bulbs with a sharp knife, and immediately some of the back eyes show signs of growing and rooting, the rhizome should be cut right through. Re-potting need not be effected until the following spring, when the severed pieces may with safety be divided, and placed in the smallest possible pots.

**INTERMEDIATE-HOUSE.**—Plants of *Oncidium incurvum* will require copious waterings until the flowers are fully open. The pretty *O. ornithorrhynchum* and its delicate variety, *album*, have already commenced to grow; as the young growths push out

their thread-like roots when only a few inches high, no time should be lost in affording them fresh material. Plants of *O. leucochilum*, of which there are several distinct varieties, are now in bloom. After the apikes have been open a few days it is advisable to cut them off, or the strain may affect the health of the plant for a considerable time afterwards. After the apikes have been removed, keep the plants rather on the dry side until growth recommences, when they may be repotted. Any plant of *Vanda cœrulea*, *V. Amesiana*, and *V. Kimballiana*, which requires more root-space should at once be attended to, growth having already started. Baskets (upright teak cylinders are the best receptacles for them in; as these allow of a free circulation of air amongst the roots, and this is indispensable to their well-doing. Plants that do not need re-basketing may have the old sphagnum removed, and be resurfaced with fresh material. Suspend them well up to the roof-glass in this house, and in the lightest and most airy position available. Abundance of water should be afforded throughout the growing season. Vandas of the *suavis* and *tricolor* sections should now receive a little extra water at the roots, their flower-spikes being just discernible. Every precaution should be taken that the plants are not placed in a position where they will receive drip from the roof, which accumulates at the base of the leaves, and causes the spikes to decay. These tall-growing Vandas require to be carefully protected from strong sunshine at all times, as they are liable to lose a number of their lower leaves if exposed for any length of time to the direct rays of the sun.

### THE KITCHEN GARDEN.

By C. HERRIN, Gardener, *Dropmore, Maidenhead.*

**MUSHROOM HOUSE.**—If beds that have been in bearing for a considerable time past begin to show signs of exhaustion, give them a good soaking with water at a temperature of from 80° to 90°; dissolve in the water about a tablespoonful of salt to each gallon as a slight stimulant. Use a watering-pot having a fine rose, and go over each bed three or four times, to make sure that the water penetrates the surface, which is not easy if the latter is rather dry. Any beds that are fully spent should be removed, choosing a warm day for the purpose, so that the door may be kept open without unduly chilling the remaining beds in bearing. If fresh manure has been prepared by frequently turning, as previously advised, the beds may be made and spawned at once. The soil, for casing the beds, should consist of good loam, and this must be in the house a day or two before it is applied, so as to get warmed. It requires to be spread over the bed rather more than half-an-inch in thickness, and be well patted down with the back of a spade. Ridges for Mushroom-growing in the open may also be made, and covered afterwards with dry, strawy litter 6 inches to 1 foot in depth, according to the weather. Continue to bring Seakale roots into this structure frequently in small quantities, so as to ensure a regular supply. Those roots left in the ground where they were grown, to produce the latest batch of Kale should now, or before growth commences, be well covered up, to exclude light. Fine leaf-mould laid on 9 inches in depth forms an excellent covering; or if the soil of the garden is of a light nature, this may be used.

**SEED SOWING.**—Another sowing of Turnips may now be made, giving preference to varieties of the Snowball type. Sow also a few seeds of Brussels Sprouts, Early London, Eclipse, and Autumn Giant Cauliflowers, and Self-protecting Autumn Broccoli, on a warm border.

**CAULIFLOWERS.**—Plants raised in the autumn and wintered under hand-lights or in frames may now be planted in a sheltered quarter of the garden. If hand-lights are in use, containing six plants each, the four corner plants may remain, and the others be transplanted to the open quarter, temporarily sheltering them with inverted flower-pots until established. Some of this stock of plants may be put out at the foot of warm walls, when, if well attended to in the matter of manure-water, they will produce excellent heads. Plants of Snowball or other early variety will now be ready for pricking-off at about 2 inches apart in other boxes or pans, or into a bed of soil in a frame on a slight hot-bed. The soil used should consist of some light kind, of which leaf-mould or old Mushroom-bed dung may form one-third, and it should be passed through a half-inch-meshed sieve. If there be space at command, some of them may be potted

in small 60's, and when grown on in this manner, they receive but little check when planted out. Air should be afforded the Cauliflower plants in sufficient quantity to prevent drawing, and to ensure starchy growth.

**VARIOUS.**—Carrots and Radishes in frames, where standing in a crowded condition, should be carefully thinned, and as neither are required of a large size, if they stand 1 inch apart it will suffice. After thinning them, afford a slight sprinkling with tepid water, and keep the frames rather close for a day or two. Potatoes in pits and frames sufficiently advanced should be afforded an earthing-up with light soil, freely ventilating them in mild weather. Cold winds have not been troublesome as yet, but in the event of their occurring, air should be given in the opposite direction to that from which the wind is blowing, and this applies to all frames containing tender vegetables. Peas that were sown in pots and on turves have made rapid growth, and will now be ready for planting out-of-doors. For the turves a drill should be drawn deep enough to lay the pieces in, pressing the soil firmly but gently up to the Peas. Those in pots should be planted with a trowel and line. After planting, all Peas should be staked without delay, and, if necessary, extra shelter may be afforded by putting a few Yew or Spruce branches on the colder side of the row. Broad Beans, sown in pots, should also be planted out, another sowing being made to follow those previously sown.

### FRUITS UNDER GLASS.

By W. POPE, Gardener, *Hitchlere Castle, Newbury.*

**PEACHES AND NECTARINES.**—In the early-house care must now be taken not to overcrowd the trees with young wood, but retain only what is sufficient for next year's fruiting, and for any desired extension of the trees. Shoots retained merely to induce sap to flow to the fruit, should be stopped at the second or third leaf, and the after-growths pinched to one leaf. Do not thin the fruit too severely at the present, in case a few should drop during the process of stoning; although if the trees are healthy, and in good condition generally, not much loss need be apprehended from this cause. In the final thinning, one fruit to each square foot of trellis will be sufficient to leave, if fruit of the highest quality be desired. Nectarines are often left much closer together, and this proportionately reduces their size. To secure the finest fruit they require just the same amount of space as Peaches. Keep the temperature at about 60° at night; or a few degrees lower in cold weather, maintain 65° by day with 10° to 15° rise by sun-heat, and close the house early at about 75°. Syringe the trees morning and afternoon in bright weather, to prevent red-spider getting a footing; but if this pest has already done so, syringe the trees with a mixture of soft-soap at a strength of 2 oz. to the gallon of water, or some other safe insecticide. Avoid cold draughts of air, and encourage the roots near the surfaces with mulchings of fresh, rich manure, and frequent waterings with tepid water. Trees started early in the year should now have dibbading completed. Any growths not required for furnishing the tree or extension should be stopped at the third leaf. Syringe the foliage regularly every morning and afternoon in fine weather, but sufficiently early that it becomes dry before nightfall. Thin the fruits gradually, removing first the smallest and those on the undersides of the branches. Keep a sharp look-out for aphides, and should any appear, fumigate the house on two or three successive nights. Trees started early in February will have set their fruits, and syringing should, therefore, be resumed. Dibbading should be done gradually, care being taken to retain a shoot near the base of the bearing shoots, and also beyond the fruit, which last must be stopped when three leaves have been made. Shoots required for extension should be laid-in thinly.

**TREES IN BLOSSOM.**—Syringing must be discontinued for a time, and sufficient moisture in the air maintained by damping all available surfaces in the morning and at closing time. The pollen may be distributed by sharply tapping the trellis in the middle of the day when the leaves are dry, or the flowers may be gone over daily with a soft brush, or a rabbit's tail tied to a stick. The temperature should not now exceed 45°, or 40° in cold weather, with 50° to 55° in the daytime. Allow as much ventilation as possible. Keep the latest trees very cool, so as to retard their flowering. Ascertain if the borders are thoroughly moistened, and should there be any suspicion of dryness, afford a good watering forthwith.

### THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, *Aston Clinton, Tring.*

**TRANSPLANTING EVERGREENS.**—Although early autumn is the best season for this operation, where much transplantation has to be done, some of it is usually left over till the spring, notwithstanding a mild winter being likewise favourable for carrying out the work in the case of the hardier evergreens. The Laurels are most useful evergreens, generally succeeding where other species fail, and growing in almost any kind of soil, although most at home in one that is strong and retentive, if the drainage is good. For planting banks or forming a hedge, few evergreens are more suitable. *Prunus lauro-cerasus* var. *rotundifolia* is one of the best for the latter purpose, being compact in growth; it is also a suitable plant for the foreground of shrubberies, where by pruning, it may be kept at any desired height; although if the latter be a consideration, *P. l. colchica* is better. The last-named is free in growth, and soon affords shelter for less hardy plants. When planting is carried out at this season, the plants require to be copiously watered after being planted, and mulched with rotten manure. Aucubas, Box, Arbor-vitæ, Yews, as a rule, move well, having generally an abundance of fibrous roots, and in strong soils holding much about these.

**CONIFERS.**—*Picea Nordmanniana*, *Abies pinsapo*, and *Cedrus atlantica* are easily and safely moved if not very large or aged, and even their transplantation may be performed safely if care be used, and the necessary appliances, as a tree-lifter, &c. are at hand. For all choice specimens of Conifers, it is advisable to thoroughly prepare the stations beforehand, trenching them 2 feet deep, and adding new soil. Before the trees, if large, have all the soil put about them, large quantities of water should be thrown in among the roots, and then the remainder may be firmly packed around, but not covering the old ball by more than 2 or 3 inches in depth with new soil. A mulch is always desirable for newly-planted trees, and this may consist of leaf-mould, Mushroom-bed manure, &c. The trees, if tall, must be guyed, and this should be done in a manner that will cause no injury to the bark. If overhead syringings can be afforded the trees in dry weather until July or August, the formation of new roots will be quickened. Smaller trees and shrubs under 6 feet in height should be secured to three stout stakes in the usual manner.

**SEEDS.**—Bidding plants that have failed should be made good at once by means of a second sowing, and, if possible, the cause of failure ascertained, so as to avert future failures.

**BORDER CARNATIONS.**—Providing the borders have already been prepared, these plants may now be planted out. Select, if possible, a fine day for the operation, and make the soil thoroughly firm about the roots.

**LILIUM AURATUM BULBS** intended for use in the flower garden may now be potted up in suitably-sized pots. Use a compost of about two parts fibry loam, one part peat, and one part leaf-mould, adding sufficient coarse sand to keep the whole porous. If the soil be in a fairly-moist state when used, little or no water need be afforded until the bulbs show growth.

**ECHEVERIA SECUNDA GLAUCA.**—The old plants should now be trimmed, and all offsets removed. The latter may be dibbled thickly together in boxes or frames in light sandy soil; some of the largest may be used during the present season. Old plants are best potted singly into 3 or 4-inch pots, so that little or no check may be felt when they are planted out. Place the plants in cold frames for a few weeks, then gradually harden off.

**EARLY-FLOWERING CHRYSANTHEMUMS** may still be propagated, and cuttings that were rooted at the proper time will now need potting on. Keep these steadily growing until all danger of severe frost is over. Nothing is gained by planting them out too early, but there is the risk of their being destroyed or greatly injured by frost or cold cutting winds.

**SEED-LISTS.**—A List of Seeds Offered for Exchange for this year has been issued from the Science and Art Department of the Royal Botanic Gardens, Glasnevin, Dublin. From the Imperial Botanic Garden, St. Petersburg, is issued a similar *Delectus seminum*.

## APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY,	MAR. 7	{ Isle of Wight Horticultural Meeting; Société Française d'Horticulture de Londres meet.
SUNDAY,	MAR. 8	{ Brussels Orchidéenne show.
MONDAY,	MAR. 9	{ United Horticultural Benefit and Provident Society, Annual Meeting in Caledonian Hotel.
TUESDAY,	MAR. 10	{ Royal Horticultural Society Committee's show in Drill Hall, Horticultural Club meet.
FRIDAY,	MAR. 13	{ Royal Botanical and Horticultural Society of Manchester show (two days).
<b>S A L E S.</b>		
MONDAY,	MAR. 9	{ Continental Plants, Tuberoses, Begonias, Gladioli, &c., at Protheroe & Morris' Rooms.
TUESDAY,	MAR. 10	{ Carnations, Lilliums, Herbaceous Plants, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	MAR. 11	{ Imported and Established Orchids, at Protheroe & Morris' Rooms.
FRIDAY,	MAR. 13	{ Japanese Lilies, Palm Seeds, Continental Plants, Roses, Gladioli, &c., at Protheroe & Morris' Rooms.
		{ Orchids from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.
		{ Hardy Perennials, Clematis, Anemones, Paeonies, &c., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41° 9'.

It is rather remarkable, considering its extreme importance, how few books there are in this country devoted to this subject. The treatises of DARWIN, WALLACE, and others, which have excited so much interest in the scientific world, and which have revolutionised thought during the last thirty years, are not adapted for gardeners' use. The number of the craft who have read and mastered any of KNIGHT'S classic memoirs or DEAN HERBERT'S papers on hybridisation, which preceded DARWIN'S work by many years, are, we suspect, extremely few. Mr. BURBIDGE'S book on *Cultivated Plants*, barring sundry faults of arrangement, which do not materially interfere with its value, remains, and long will remain, a classic. It does not redound to the credit of the gardening community that so valuable a book should be allowed to remain in its first edition. Although not up to date, it comprises a body of information on the methods adopted for the amelioration of plants not to be found in equal amount in any other book known to us.

Professor L. H. BAILEY, of the Horticultural Department of Cornell University, Ithaca, N.Y., has now reprinted in one whole some lectures which he has given on various occasions on subjects dealing with the general principles of plant amelioration as viewed in the light of evolution. We commend this little treatise, which may be had from Messrs. MACMILLAN for a small sum, to the notice of all thoughtful practitioners, in the assurance that if digested and acted on, much fruitless labour will be avoided, and system and method introduced where now too much is left to chance. The subjects discussed are: variation and its causes, the struggle for life, the division of labour, the principles and practice of crossing. As an appendix, Professor BAILEY reprints the valuable lists of bud-variations drawn up many years ago by CARRIÈRE and VERLOT, but omits the

additions to them made in DARWIN'S *The Variation of Animals and Plants under Domestication*. As these papers are not very accessible, Professor BAILEY has rendered good service by repeating them, as also by translating and reproducing one of the chapters in Dr. FOCKE'S work on hybrids. There are many points which invite attention did our space permit it, but we may allude in passing to the acknowledged rarity of hybrids in nature. Prof. BAILEY, who is an authority on *Carex*, says that that large genus, though apparently favourably endowed for purposes of cross-fertilisation, produces few hybrids. We can say the same of the nearly-allied *Restiaceæ*. On the other hand, hybrid Orchids are more numerous, and one reason for the difficulty of identifying *Passifloras*, especially *Tacsonias*, probably arises from the way in which they intercross. These latter flowers are fertilised by insects, or perhaps also by humming-birds, whilst the *Carex* flowers, like the *Restias*, are, we presume, wind-fertilised. We cannot now do more than refer to Prof. BAILEY'S own experiments with *Squashes* (Vegetable-Marrows), Egg-plants, and other plants, which are very interesting. "And now," he says, "the sum of it all is this: encourage in every way crosses within the limits of the variety, and in connection with change of stock; expecting increase in vigour and productiveness; hybridise if you wish to experiment, but do it carefully, systematically, thoroughly, and do not expect too much. Extend DARWIN'S famous proposition to read: "Nature abhors both perpetual self-fertilisation and hybridisation." The Professor lays great stress on the necessity for the experimenter having before him a clear idea of what he seeks to obtain, and what are the most likely methods of accomplishing it. To this end he lays down certain rules, which we reprint, referring the reader to the original for the comments by which each rule is accompanied.

1. Avoid striving after features which are antagonistic or foreign to the species or genus with which you are working.

2. The quickest and most marked results are to be expected in those groups or species which are normally the most variable.

3. Breed for one thing at a time.

4. Do not desire contradictory attributes in any variety.

5. When selecting seeds, remember that the character of the whole plant is more important than the character of any one branch, or part of the plant; and the more uniform the plant in all its parts, the greater is the likelihood that it will transmit its characters.

6. Plants which have any desired characteristics in common may differ widely in their ability to transmit these characters.

7. The less marked the departure from the genus of the normal type, the greater, in general, is the likelihood that it will be perpetuated.

8. The crossing of plants should be looked upon as a means or starting-point, not as an end.

9. If it is desired to employ crossing as a direct means of producing new varieties, each parent to the proposed cross should be selected in agreement with the rules already specified, and also because it possesses in an emphatic degree one or more of the qualities which it is desired to combine; and the more uniformly and persistently the parent presents a given character, the greater is the chance that it will transmit that character.

10. Establish the ideal of the desired variety plainly in the mind before any attempt is made at plant-breeding.

11. Having obtained a specific and correct ideal, the operator must next seek to make his plant vary in the desired direction.

12. The person who is wishing for new varieties

should look critically to all perennial plants, and particularly to trees and shrubs, for bud varieties or sports.

13. The starting point once given, all permanent progress lies in continued selection.

14. Even when the desired variety is obtained, it must be kept up to the standard by constant attention to selection.

15. It is evident, therefore, that the most abiding progress in the amelioration of plants must come as a result of the very best cultivation, and the most intelligent selection and change of seed.

**ALPINIA NUTANS.**—Our illustration, fig. 42, p. 301, shows a plant of a genus not common in English gardens, but frequently met with on the Continent. The *Alpinia* (*Globba*) form a rather large genus of stove, herbaceous perennials of much beauty of flower, and elegance of habit. The flowers are disposed in terminal spikes, those of *A. nutans* being pink coloured, of agreeable fragrance, and the spike drooping. The leaves are lanceolate, smooth, entire, and sheathed at the base. The roots are fleshy, like most *Zingiberaceæ*, and have much the taste and aroma of ginger. *Alpinias* require a high temperature, rich soil, and plenty of root-space, therefore they succeed better when planted in borders or large tubs; and frequent applications of liquid-manure and rich mulches are essential to vigorous growth, and without this flowering is poor, or altogether repressed. Soon after flowering the leaves assume a yellow tinge, and water should be withheld, but much drying off must not be practised. They must not be exposed to less heat when at rest than at other times. The flowers appear in May. We are indebted to the kindness of the Marquise Strozzi, Florence, who sent us a photograph, for the opportunity of furnishing our readers with a figure of *Alpinia nutans*.

**ROYAL HORTICULTURAL SOCIETY.**—The next Fruit and Floral meeting of the Royal Horticultural Society will be held in the Drill Hall, James Street, Westminster, on Tuesday, March 10, from 1 to 4 P.M. A lecture on Melons will be given by Mr. JAMES BARHAM, at 3 o'clock.

**NATIONAL ROSE SOCIETY.**—A meeting of the General Purposes Committee will be held, by kind permission of the Horticultural Club, at their rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 10th inst., at 2 P.M. Another meeting will take place at 3 P.M. of the Committee. The business to be transacted at the earlier meeting consists of a discussion on the supplement to the catalogue, and other matters. An essay will be read on "Hybridisation of Roses." At the later meeting, reports will be presented by the General Purposes Committee, and the Schedule Committee, &c.—Special Prizes. Offers of special prizes to be awarded at the Crystal Palace will be thankfully received. The following have been already promised:—

"An Amateur" ... ..	£16 0 0	and two Silver Cups.
Messrs. Bunyard & Co. ...	5 0 0	
Mr. B. R. Cant ... ..	5 0 0	
Mr. R. H. Langton ... ..	3 0 0	
Mr. H. V. Machin ... ..	5 0 0	
Mr. E. Mawley ... ..	2 0 0	
Mr. O. G. Orpen ... ..	2 10 0	
Mr. C. E. Shea ... ..	2 0 0	
Mr. J. T. Strange ... ..	2 0 0	
Veitch Memorial Committee	10 0 0	and two Medals.

H. HONYWOOD D'OMBRAIN { Hon. Secs.  
ED. MAWLEY }

**HONOURS TO THE GARDENING PROFESSION.**—An appointment has been made which is unique, and may not again occur. About a year ago, Mr. F. N. SHAPE, of Wisbech, the junior partner in the old-established firm of H. & F. SHAPE, seed-growers and nurserymen, of Wisbech, was appointed High Sheriff of the joint counties of Cambridgeshire and Huntingdonshire, and Deputy-Lieutenant of the former county; his brother, Mr. HENRY SHAPE (the senior partner), having been appointed three years previously to the same office. "This, I believe," says our informant, Mr. S. W. MITFORD, "is the only instance in England and Wales where a High Sheriff is appointed for two counties."

LONDON WHOLESALE FRUIT AND POTATO TRADES AND GROWERS' BENEVOLENT SOCIETY. — Mr. GEORGE MONRO writes:—"I have the pleasure to inform you that I have consented to

Although only established about three years, the necessity of the society is evidenced by the applications for help which have already been sent in; and it is a source of much satisfaction to me to be able

the other, the widow of a grower who had attended Covent Garden Market, 10s. a week. Seeing so short a time has elapsed since the formation of the society, I think you will agree with me that it is

FIG. 42.—ALPINIA NUTANS. Colour of flowers pink. Height to which a plant will grow, 12 feet. (See p. 300.)

preside at the annual Festival Dinner in aid of the funds of this society, to be held at the Holborn Restaurant on March 10, and as I am most anxious that the occasion should be a marked success, I very earnestly solicit your kind aid and co-operation.

to state that three deserving candidates, whose cases were of an urgent character, are now, to their great comfort, being assisted from its funds—two, who were formerly salesmen at Covent Garden and King's Cross, receiving pensions of 15s a week each; and

doing an excellent work, and one which commends itself to all those who are charitably disposed. In following such chairmen as my predecessors, viz., Sir STEART KNILL, the Hon. W. F. D. SMITH and Sir SAMUEL MONTAGUE, I cannot overlook the fact

that my task must necessarily be a somewhat difficult one; but I feel sure, as this will be the first festival at which a member of the trade will occupy the chair, I may confidently anticipate your practical sympathy and support. You are probably already a subscriber to the society, and I trust you will be present at the dinner. Should you, however, be unable to attend, I very earnestly appeal to you to induce your friends to send me a donation or annual subscription; and under the special circumstances I have mentioned, I beg you, in addition to your kind annual gift, to forward me a contribution to my dinner list in such proportion as you may be inclined. If, in my anxiety on behalf of the society whose claims I have to advocate, I may seem to be a little importunate, I would remind you that, "in the sacred cause of charity, extortion is a virtue." *Geo. Monro, Covent Garden.* [We sincerely hope that there may be many victims of this form of importunity.]

**GARDEN CINERARIAS.**—The *Revue Horticole* holds to the opinion that our garden Cinerarias are the result of the crossing of *Senecio cruentus* with *S. populifolius* in the first instance, and subsequently of further crosses with various species from the Canary Islands and Madeira.

**THE LATE DR. W. R. WOODMAN.**—The committee of the Woodman Memorial Fund propose to erect a memorial over the grave, and to make a further tribute to the memory of this well-known horticulturist, in the shape of an offering to the widow. Mr. SHERWOOD is Chairman of the committee, the Treasurer is Mr. E. J. JARMAN of Chard, and the Hon. Secretary, Mr. W. NAPPER, 489, Kiog's Road, Chelsea. Numerous subscriptions, ranging from 2s. 6d. to £1 1s. have been received.

**THE ANCIENT SOCIETY OF YORK FLORISTS** is a vigorous institution, and in addition to the shows annually held under its auspices, arrangements are provided for the discussion of horticultural subjects by its members. The annual report for 1895, and fixtures for the present year, are before us. The first show will be held on April 22, and the others on May 20, July 1, August 5, and September 2. These are for members only, but in addition there is held a great Chrysanthemum and fruit show, which includes classes open to all. This will take place on November 18, 19, and 20. There are ten occasions when papers will be read and discussion invited. It is satisfactory to find that the Society is stronger and more useful than ever.

**PRECIOSA: A NEW HYBRID TEA ROSE.**—This is offered for sale by Mr. L. VIEVEG, Quedlinburg, as a new Rose, flowering the whole season. It is stated to be the result of a cross between *Niphotos* and *Madame Pierson*, H.P. The flowers are described as glowing-carmine, very fragrant. "Preciosa is in spring the first in bloom, and in autumn the last."

**GARDENERS IN THE UNITED STATES.**—Mr. ROBERT FARQUHAR, the son of our old correspondent, whose death we recently recorded, sends us from Baton, United States, a paper which he read before the Gardeners' and Florists' Club of that city. The subject was "The Profession of Gardening in the United States, what it is, and what it may become." Mr. FARQUHAR traverses well-known fields, and concludes by proposing the formation of an American gardeners' association, the chief object of the society being the "ennoblement of the profession of gardening." The association is to comprise a board of examiners, consisting, say, of five of the best and most respected head-gardeners, men of acknowledged ability, who would proceed to test the ability of the candidates to dig, transplant, pot, prune, &c. Acquaintance, or the want of it, with plants, varieties, seasons of sowing, soils, and methods generally could be ascertained by oral examination. Candidates succeeding in this examination should receive a diploma, and be registered on the list of gardeners seeking situations.

**TECHNICAL INSTRUCTION IN HORTICULTURE IN ABERDEENSHIRE.**—The course of lectures on horticulture which is being given at Kintore, Aberdeenshire, by Mr. JAMES WILSON, F.R.H.S., the County Council lecturer, was resumed on Tuesday evening, February 25th, the subject for the evening being the cultivation of garden vegetables, which, in the capable hands of Mr. WILSON, proved very interesting and instructive. The lecture was, as usual, fully illustrated by means of diagrams and charts, and was listened to most attentively by the audience. The course was concluded on Thursday evening, following, when Mr. WILSON'S subject was, "Gardening as a Recreation." This was, perhaps, the most interesting lecture of the course. Mr. KEYS, who occupied the chair, in proposing a vote of thanks to the lecturer, spoke to the value of the instruction given, and to the interest manifested in the subject. Although this course of lectures is a new departure in the Aberdeen County Council's scheme for disseminating technical instruction, it bids fair to become a very popular and instructive one, the lectures having been very generally appreciated.

**'LES FONDERES, ORGANOGRAPHIE ET CLASSIFICATION,** par MM. HOOKER, BAKER et SMITH, is the title of a very good and well-illustrated translation of the useful work on Ferns so well-known to students in England. The French translation is by M. CHAS. MARON, and notes are appended from the pens of MM. L. FODANIER, of Marseilles, and MARON. The work is published by M. OCTAVE DOIN, Place de l'Odéon, Paris, and being illustrated by about 320 figures, it should do much to extend the culture of Ferns, so as to take in the botanical species more largely than they at present appear in continental gardens.

**CHITRAL FERNS.**—We are glad to see that military exigencies did not stand in the way of attaching botanical collectors to the Chitral expedition. In the current number of the *Journal of Botany* is an article by Mr. W. C. HOPE on the Ferns met with *en route*. Perhaps we may hear similar good news from the Ashanti expedition. The deletion of botany from the studies of medical men may in future operate injuriously in this matter. Formerly all medical students had to make themselves acquainted with some amount of botany, and a reference to the history of botany, especially in India, will show how very large a proportion of botanical work was done by medical officers.

**TASMANIAN FRUIT.**—We are advised that the first steamer with fruit from Hobart, is the Orient Company's steamer *Orinoco*, sailing about February 25, and due here about April 10; also that the vessel will be followed weekly by steamers of the P. & O. and Orient lines, until about the end of April. The total shipment for the season of both company's steamers is expected to be about 178,000 boxes.

**ROYAL GARDENERS' ORPHAN FUND.**—The first meeting of the Committee was held after the annual general meeting took place on February 28, at the Horticultural Club. Mr. WILLIAM MARSHALL was unanimously re-elected Chairman of the Executive Committee for the year ensuing. The minutes having been read and confirmed, the Secretary reported the results of the recent election, and guardians were appointed for several of those elected on the Fund. The Secretary announced special receipts as follows:—Mr. M. Todd, Maitland Street, Edinburgh, sale of flowers at Chrysanthemum show, £20; Mrs. Wills, Oslow Crescent, S.W., £5; Midland Carnation and Picotee Society, per Mr. R. Sydenham, £5; Mr. J. Hughes, High Street, Harborne (box), £1 17s. 3d.; Mr. H. Percy Dodson, Courtfield Gardens, S.W., £1 1s.; Penhurst Gardeners' Assoc. (Mr. E. Baker, Sec.), £1; collected from the Axminster Gardeners' Association, by Mr. J. Crooke, Chard Abbey, Chard, 17s. 7d.; Mr. R. Vanstone, Clive Nursery, Exeter, 16s.; Mr. W. P. Pearce, Belmont, Lee, 12s. 6d.; Mr. W. Whittaker, Stocklands, Bridgwater, 10s.; Mr. H. Perkins, Greenlands, Henley (box), 10s. Mr. F. Roberts, The Gardens, East Cliffe Lodge,

Ramsgate, was elected local Secretary, in the place of Mr. J. M. Miller of Margate, who had resigned; and Mr. R. Weller, The Gardens, Glenstall Castle, Nurree, was elected local Secretary for the Limerick district.

**COMING EXHIBITIONS.**—We have just received the schedule of Prizes to be awarded at the Wolverhampton Floral Fête, to be held on July 7, 8, and 9 next. The extent of the exhibition is likely to be larger even than usual. There are 100 classes including sections limited to amateurs, cottagers and gentlemen's gardeners, in addition to the open ones. For the important exhibits of sixteen stove and greenhouse plants, and a group of plants arranged for effect, the 1st prize in either case is £20. In the classes for Roses, fruit, &c., the committee are equally liberal, the prizes offered in the class for a collection of fruit being equal to £19. The horticultural secretary is Mr. W. A. GREEN, Jun., Corporation Street.

THE ECCLES, PATRICKGOTT, PENDLETON, AND DISTRICT CHRYSANTHEMUM SOCIETY held their annual meeting on the 24th ult. It was decided to hold their show this year on November 13 and 14.

THE BEDDINGTON, CARSHALTON, AND WALLINGTON HORTICULTURAL SOCIETY have arranged to hold their exhibition on Monday, August 3, in Carshalton Park.

SHROPSHIRE HORTICULTURAL SOCIETY.—The spring show under the auspices of this far-famed Society, will take place on Wednesday, March 25. The prizes are for spring flowering plants and bulbs, and there are forty-three classes, of which twenty-two are open ones. The great floral *fête*, Aug. 19 and 20, with its 190 classes, promises to be again one of the finest exhibitions of horticulture in Britain. We have not space to notice the schedule at length, but may mention only a very few of the most important of the classes. The groups of plants arranged for effect at Shrewsbury, are unsurpassed anywhere, and we notice that great encouragement is again given by the committee to exhibitors of these. The 1st prize in this class is £25, and the total sum of the four prizes is £63. Twenty-five pounds are also offered for the best collection of twenty stove and greenhouse plants. The best prize in the section for cut flowers is offered for a display of floral arrangements in a space 12 feet by 5 feet, this class accounting for £35. Turning to the fruit section, we find that the class for a "decorative table" of dessert fruits, of which we had occasion to speak favourably last season, again constitutes the principal competition. The four prizes are awarded in guineas, the winner of the 1st taking 15 guineas and a gold medal, of the 2nd 12 guineas, the 3rd 8 guineas, and the 4th 5 guineas. A list of fruits is given from which may be selected sixteen dishes for exhibition. The exhibits are to be judged by points, and the point value of each fruit is given in the schedule. The highest number of points for a bunch of Grapes or dish of fruit is that of ten to the Pineapple, black or white Grapes may receive six; Peaches, Apricots, and Nectarines, eight; and all other fruits, six. Twenty-four points may be awarded to different features in the arrangement of the exhibit. The number of points awarded to each collection will be placed on the exhibits obtaining the prizes. Entries should be made on or before August 12. The Hon. Secs. are H. W. ADMITT and W. W. NAUNTON.

CHESTER SUMMER FÊTE.—We have received the schedule of prizes to be offered at the horticultural show to be held in connection with the Summer Fête at Chester on August 5 and 6. The Chester people have awakened suddenly to a sense of their opportunities, and are now [with the Duke of Westminster as their president] displaying very great energy and speculation, in the hope of establishing a horticultural show on the lines of the successful exhibitions held annually at Shrewsbury and York, and latterly at Wolverhampton. As already announced, Chester was the first society to invite the Royal Horticultural Society into the province since the recent discussion upon this subject, and it is equally well known that Chester is one of the places that the Royal Horticultural Society has decided to honour with a deputation during the present

year, though it is less certain what power that deputation will be invested with. One of the most valuable of the disbursements the deputation will have at its disposal is a silver cup valued at £10, which a member of the Council of the Royal Horticultural Society has offered to celebrate the event of the Society thus patronising the provincial shows. Endeavours are being made to arrange a horticultural conference, to take place on the evening previous to the exhibition. The schedule embraces 117 classes, large and small, and is much similar to that of older societies. The thoroughness with which the committee have entered into the affair may be calculated by the high prizes in the principal classes that are offered on this first occasion. The class for a group of plants is allowed £55, the winner of the 1st prize taking £25. It is expected there will be considerable competition in the class for a group of Orchids occupying 150 square feet.

PLANT PORTRAITS.

- BOLBOPHYLLUM CARINATUM VAR. COGNIAUXI.—A new species from Borneo, remarkable for its attractive foliage and curious flowers. *Lindenia*, t. CDXCIV.
- CATASETUM FIMBRIATUM VAR. COGNIAUXI, *Lindenia*, t. CDXCIX.
- CATASETUM PUNCTATUM, Rolfe, *Lindenia*, t. CDXCVI.
- CATTLEYA [MOSSIE] ALICIE, L. Linden.—A lovely form with white segments, the frilled lip being carmine, with a white edge. At present the plant is unique. *Lindenia*, t. CDXCIV.
- CATTLEYA SKINNERI, Lindl., var. oculata, *Lindenia*, t. CDXC.
- CYPRIPEDIUM AYLINGI X, Stand Hall variety.—A cross between *C. niveum* and *C. ciliolare*. *Lindenia*, t. CDXCVIII.
- CYPRIPEDIUM EVENOR X.—A lovely hybrid, whose parents were said to be *C. Argus* and *C. bellatulum*, whilst others suppose it to be the offspring of *C. Argus* and *C. concolor*. *Lindenia*, t. CDXCVII.
- LELIO-CATTLEYA SCHULZIANA X, L. Lind.—A cross between *Lelio-Cattleya elegans* and a variety of *Cattleya labiata*. *Lindenia*, t. CDLXXXIX.
- ODONTOGLOSSUM CRISPUM, VAR. LUTEO-RADIATUM.—A form in which each of the pure white perianth segments is traversed with a central gold-coloured band. *Lindenia*, t. CDXCII.
- ONCIUM ONUSTUM Lindley, *Lindenia*, L. CDXCVIII.

COMING OF AGE OF MR. E. G. MONRO.

ON Saturday, February 29, Mr. G. Monro, the well-known salesman of Covent Garden Market, entertained the whole of his staff, together with the members of his family, the leading senders and customers with whom he has business connections, and a few friends, at a dinner, at Simpson's Divan, to celebrate the majority of his eldest son—Mr. Edwin George Monro. It is rarely seen that the head of an important commission salesman's business, with his working staff of all grades, meet at the same social board, together with the capitalists who produce the goods, and the wholesale traders who purchase them. Still rarer is it to find both producer or sender and buyer vying with each other in evident sincerity in paying tribute to the middle man, whose integrity and business capacity they unite in praising, and whose difficult

FIG. 43.—ESPALIER TREE OF PEASGOOD'S NONSUCH APPLE, AS GROWN AT EAST SUTTON PARK.

The prizes are £20, £15, and £10. The 1st prize for twelve stove and greenhouse plants is £15. The principal class in the cut flower section has been provided for with equal liberality. There is to be a tasteful arrangement of fruits as for dessert at Chester, and £30 will be awarded to the three best exhibitors. About forty-three classes have been reserved for cottagers. On the whole, the effort promises to meet with unequalled success, which we hope it may secure. The hon. secretary is Mr. J. WYNNE FEOLKES.

NEW PUBLICATIONS.—A Contribution to our Knowledge of Seedlings, by the Right Hon. Sir JOHN LUBBOCK, Bart., M.P. Popular edition. (KEGAN PAUL, TRENCH, TRÜBNER & Co.)—The Spraying of Plants, &c., by E. G. LODEMAN. (MACMILLAN & Co.)—Manuel Pratique de Culture Fourragère, C. & H. DENAÏFFE. (Paris, BAILLIÈRE.)—Nouveau Dictionnaire des Plantes Médicinales, par Dr. A. HERAUD. (Paris, BAILLIÈRE.)—Thirteenth Annual Report of the New York Agricultural Experiment Station.—Ausländische Kultur Pflanzen, with atlas, by KARL BOLLMANN. (HERMANN SIPPPEL.)

- RHYNOSTYLIS RETUSA, Blume, better known as Saecolabium Blumei, *Lindenia*, t. CDXCIII.
- STAUROSPIS LISSOCHILOIDES, alias Vanda Batemani, *Lindenia*, t. D.
- VANDA SPATHULATA, Sprengel.—A golden-yellow Vanda, growing from Mysore to Ceylon, long known to botanists, but not familiar as yet to cultivators. *Lindenia*, t. CDXCI.

PEASGOOD'S NONSUCH APPLE.

WE had recently the pleasure of illustrating a bush of Cox's Pomona Apple, as grown in the gardens of Thomas Oliveron, Esq., East Sutton Park, Staplehurst. By our illustration (fig. 43) is represented an espalier tree of the variety Peasgood's Nonsuch, from the same garden, equally remarkable for its excellent crop of large-sized and well-coloured fruits. This large exhibition variety is so well known, that no description is needed here, but Mr. Lewis, the gardener at East Sutton Park, may be congratulated upon such successful Apple culture as the photographs portray. Some of the fruits measured 1 foot 3½ inches in circumference, and they were exceedingly well coloured,

and delicate position they fully appreciate. No finer tribute could be paid to any man's character for honest dealing and to his business ability after a twenty-five years' business acquaintance. This notable appreciation and real good-will found expression in various presentations that were made and in the good-will shown toward the son. First the growers, represented by Messrs. Sweet and Kay, gave a handsome and massive gold albert chain and a ruby and diamond pin and stud; next, the buyers, represented by Messrs. Brooks and Webber, gave a useful case of table cutlery, evidently with an eye to the near future. Then the staff, ably represented by Messrs. North and Phillips, gave a dining-room timepiece, together with a handsomely-framed illuminated address, the work of one of their members, Mr. James, and signed by the fifty-seven employes. Amongst other presents were a valuable gold watch by Mr. Randall, and an umbrella and walking-cane by the Manchester friends. The speeches by the gentlemen making the presentation, and the response by Mr. E. G. Monro, were marked by earnestness and discretion.

The toast—the Health of the Chairman and giver of the feast, was entrusted to Mr. Butt, who happily and worthily performed the agreeable task. Mr. Monro's reply was full of feeling and earnestness, and his well-chosen words in praise of his staff indicated much personal interest in their welfare. The songs and recitations by the members of the company enlivened the evening, which was happily spent, and terminated by a verse or two of "Old Lang Syne."

## HOME CORRESPONDENCE.

**LARCH DISEASE.**—I have many Larch plantations of ages varying from ten years old to forty or fifty, which are quite free from disease, and growing healthily. I have others of similar ages which are more or less diseased. Your correspondent, "J. S. W." says that the disease is universal, and does not depend upon favourable or unfavourable conditions. What does "J. S. W." consider that it does depend upon? The Japanese Larch (*Larix leptolepis*) is hardy and healthy with me, and I have a good many seedlings from it, but it is said to be a smaller tree than the Swiss Larch, and it seems to be a slower-growing tree. The red and black American Larches are neither of them so good for general planting as the common Larch. The red Larch in some soils grows as fast as the common Larch, and to as large a size, but the timber is not so good. The black Larch is a swamp tree in America, and only thrives with me in wet sandy soils, and there it grows slowly. I do not know what is the quality of its timber. *C. W. Strickland.*

**THE TIMBER OF THUYA GIGANTEA OR LOBBI.**—Your correspondent, pp. 200 and 242, do well in calling attention to this valuable and quick-growing Conifer. On the estate on which I am employed, some hundreds of them exist, growing in very varied kinds of soil—in soft clay, on chalk, and in wet swampy places—and in all they are equally hardy and healthy. The plant can be easily propagated by cuttings, layers, or seeds, and 18° of frost, with a strong wind, which seared the common Yew on our hill-sides, did not mark the *Thuya gigantea*. As your correspondent, p. 242, makes allusion to the woods at the Colonial exhibition, I may say that I particularly noticed the polished shaft of *Thuya gigantea* in the Canadian collection, and thought it was one of the handsomest woods exhibited. *R. M., Newbury.*

**SNOWDROPS** have been fine this year. A great breadth of the turf under the trees is carpeted with them. The newer kinds do not, as a rule, increase very fast. I had a fine lot of *Galanthus Fosteri* two years ago, and was in hopes to get it strongly established, but disease appeared among the bulbs in 1892-1893, and nearly exterminated them. I suppose plants are in some respects like animals—the more highly they are bred, the less they are fitted to take care of themselves. *D. M., Dunrobin.*

**GLADIOLUS, HARDY.**—Your correspondent, "A. D.," at p. 208, says that these Gladioli "do not suffer from frost." Perhaps they do not, but they are certainly killed outright by it. Has "A. D." ever tried the experiment of exposing a choice collection of these valuable flowers? Surely not! If so perfectly hardy, why does every gardener lift them each year, and put them in a place "secure from frost?" Mr. Kelway, of Langport, says frost is harmful; and I supposed this fact to be commonly known. Some of the species and the *Lemoinei* section are hardier, but the latter are not absolutely so in all localities. A year or two back many thousands of *G. Colvillei* albe, which were in a cold frame and covered thickly with litter, were killed outright by frost; and even the well-known *Brenchleyensis* cannot be safely left in the ground during a severe winter. *J.*

**RULES OF JUDGING.**—The matter adverted to by "Judex" (p. 242) will no doubt receive the fullest attention in due course. So far, however, as relates to what he regards as defining quality, intrinsic worth, difficulty of cultivation, &c., it must not be forgotten that these are points to which intelligent and capable judges will always give weight in making awards. It does not of necessity follow that all the dishes in opposing collections should be identical, but, all the same, let these collections be ever so large, very many of the dishes will be of identical

kinds or varieties; but section 50 practically includes every description of fruit specially exhibited for competition. The points placed against each kind simply convey not so much actual as relative value; and in Grapes, for instance, whilst, with the exception of Muscat of Alexandria, always the highest flavoured, and one of the finest and handsomest of show Grapes, the giving to other white Grapes and all black Grapes a maximum of nine points is but a guide as to the merits of the very best specimens in each case, and whether white or black, if really first-rate they deserve the highest number of points, as if by second or third-rate, whether in quality or in finish, they can be pointed as low down as may be found desirable. Surely with a table of maximum points, as is found in paragraph 50, to indicate relative values, there should not be the slightest difficulty in coming to a right conclusion as to the relative merits of two or several competing collections of fruit. If all judges start from the same maximum, then some uniformity in judging may be eventually looked for. *A. D.*

**THE LITERATURE OF GARDENING.**—At first sight, this may appear to be a somewhat formidable heading! the object, however, is not to write an essay on a subject that commences with the earliest historic period, but to call brief attention as to what might be called an expansion of book (gardening) knowledge, amongst the younger members of the craft particularly. It must have often struck those who are given to thinking at all on the matter as to the (perhaps inevitable) high price of good books on gardening matters, books that should be in the possession of every young man who has made gardening his vocation, and means to excel in it. To illustrate what I mean, take the *Gardeners' Assistant*, by the late Robert Thompson of which it was announced some time ago that an up-to-date issue was being prepared—an issue that will be very eagerly looked for. Its very price, however, thirty-five shillings, prohibits its general possession by those to whom it directly appeals as a work that has been well-described as the most comprehensive one in the English language on the many subjects it treats. It is to be earnestly hoped that the publishers of the new edition may see their way to considerably reducing its price; such an enterprising policy would have the much-to-be-desired effect of increasing its circulation. This work was issued in parts, which perhaps, in a measure, mitigated the evil, but it is the experience of those who have anything to do with taking such publications by this method, that in the end this is an expensive way of purchasing books, and oft-times the buyers tire of the matter and never complete the purchase, and so all interest is unfortunately lost. In connection with a few *Gardeners' Improvement Associations* (whose rapid growth of recent years is a most satisfactory sign of the times), notably, the Birmingham Association, there is a library in which may be found all the best gardening books published, affording a real treat to those of a literary turn of mind, and who are likewise anxious to be well read in all that concerns their daily avocations, affording them, too, a profitable occupation of time that might be less auspiciously employed in these times of particular temptation to young men. It is Montesquieu, the famous writer, who has given expression to the opinion that "Study is a remedy against the ills of life; there is no vexation which an hour's reading cannot mitigate." Could not the library idea be extended to every gardeners' association in the country? The fee at present attaching to membership of these is but a nominal one, and a slight increase upon it would form the nucleus of a sum which could be spent annually in purchasing some reliable book or books which would be the common property of all, obtained at small personal sacrifice, and be the means of diffusing much horticultural light in what are at present dark places. In these days of universal education, when, indeed, knowledge is power, gardeners (of all professions) must not be behind in a thorough acquisition, theoretically and practically, as to the *pros* and *cons*, of that by which they subsist, and any scheme, library or otherwise, having for its main object the attainment of such a desirable end is well worthy of serious attention. *J. B.*

**DENDROBIUM WARDIANUM.**—Your correspondent, Mr. Hebden, deserves the thanks of a great many of your readers for his description of the treatment he adopts with this beautiful, if somewhat difficult, Orchid. Having lately had an invitation

from Mr. Hebden to visit him, I went to Welham Hall, Retford, and saw among other good things, his *Dendrobium*. These plants were in a stove, suspended in baskets from the roof, about 100 plants altogether, the greater part being full of flower, hanging in masses, quite a glorious sight, and a most unusual thing to see on plants imported seventeen years before. All were in the finest condition, with long stout pseudo-bulbs. On some of the plants I counted seventy-five large flowers. They were imported by Hugh Low & Co., Clapton. I may say that Mr. Hebden has told only one half of the story of his successes, for his *Dendrobium* form a sight of floral beauty not soon forgotten. *William Day, Sandycote, Sheffield.*

**RAILWAY PACKING-BOXES.**—"J. H." (p. 243) suggests that these may not be strong enough to stand the strain of a single journey by railway. Most of those that have seen them seem to think they are strong enough; the test of experience will soon set the matter at rest. The larger boxes have thicker ends than the smaller ones; the sides, tops and bottoms, are also strengthened. In the entire series as much lightness is given as is compatible with safety, and much weight has been got rid of, which is one of the greatest obstacles to the reduction of railway rates. Hence, this vigorous effort to lessen the cost of carriage through lightening the boxes. Space is also economized by the uniformity of the shapes and sizes; and the convenient innovations of the railway companies in this matter should be heartily welcomed by, and prove of special value to producers. They can certainly carry fruit as they now are made, or they may readily be strengthened sufficiently to do so; but even as they are, I see nothing to hinder several of the sizes being used to carry soft fruits, such as Cherries, Strawberries, Gooseberries, Currants, Plums, Apricots, Peaches, Apples, and Pears, in punnets, for delivery direct to the houses of consumers; while for such vegetables as Peas, Beans, new Potatoes, Seakale, Rhubarb, Aparagus, Cucumbers, French Beans, Tomatoes, Mushrooms, packed either in mass or in punnets, such boxes are invaluable. Neither will anyone contend that they are not strong enough for flowers. As to the divisions of tops and bottoms into two halves, a few sheets of paper will make the boxes air-tight and dust-proof. Most packers also welcome the abolition of ties and strig as a great boon, as "J. R." may rely on French nails that they will be the very last part of the boxes to give way. Since writing about these matters, I have had several opportunities of visiting Covent Garden Market, and examining some of the thousands of foreign packages which come there; and, with the one exception of the barrels of fruit, and a few foreign boxes, the one prominent feature that impressed me was the strength and lightness of the packages, and the freshness and general excellency of the products. Of the thousands of consignments of produce disposed of in this one market, one is obliged to admit all alike good, and all good alike. Assuredly they have not suffered on the journey through the flimsiness of the boxes, &c., in which they were sent. *D. T. F.*

**EARLY NESTING OF THE BLACKBIRD.**—It may interest some readers of the *Gardeners' Chronicle* as showing the mildness of the season, that in a tree, with a little Ivy clinging to it, growing near to a stoke-hole in this garden, I saw to-day (Feb. 26) a blackbird's nest, with four eggs in it, on which the hen bird was sitting. The nest has no protection, and is not more than 3 feet from the ground. It seemed to me very early for a blackbird to be sitting. *J. Slater.*

## FLORISTS' FLOWERS.

### SEASONABLE HINTS ON THE CULTURE OF CHRYSANTHEMUMS.

The mild weather is favourable to the growth of the earliest batch of young plants, and those which are meant to produce exhibition blooms are keeping robust and stocky-looking. My plants average 6 inches in height, and they are standing on a warm shelf to which the sun has access, close to the glass, and directly under the ventilators of a lateinery which is not yet started. Growth is in consequence

such as is desirable in the early stage, that which is weak or drawn being incapable of throwing first-class blooms. There is a great deal in laying a good foundation at the first, and I think many cultivators, who now do not come up to the mark, would do better if they bore this in mind. In a short time the earliest plants must go into fresh quarters, as the vinery will be closed for forcing, and no place is better for the plants than a cold frame placed in a sunny spot, sheltered from north and east winds. They should stand on a thick layer of finely-sifted coal-ashes, and the frame should be sunk in the soil, so that the plants may stand close to the glass, the frame being raised as the plants need more head-room. The frame should not be fully ventilated for a few days after the plants are put into it, to enable them to become accustomed to the cooler conditions of the frame. It would be prudent to use tepid water in watering for some time to come. Cold water, if applied to the roots on the removal of the plants from a relatively warm-house, will often cause the foliage to change from a deep green to a pale sickly hue. If such unhealthiness is observed in any of the plants, the proper course to take is to keep them on the dry side for a time—that is, till a change for the better is apparent. The earliest-rooted plants having filled their pots with roots, will need transference to larger ones—any curtailment of root space, if long endured, causing a check. Flower-pots 5½ inches in diameter will be large enough for the next shift; and the compost described on page 107 of the present volume will be suitable at this time, if half-a-part of half-decayed stable-manure and finely-broken charcoal, where the loam is of a heavy nature, be added. It should not be sifted, but chopped to pieces with a spade sufficiently small to render potting easy. The usual precautions in regard to affording good drainage and making the soil firm about the plants, should be strictly observed. The potting-soil should when used be moist, so as to do away with the need to afford water directly after repotting, and the plants should receive sufficient water before repotting, as to ensure the soil being thoroughly moistened. The frame should be kept close for a few days after potting, unless the weather should be very favourable for the production of roots. When a start in growth has been made, air may be admitted freely, the lights being drawn off the frame in fine weather. Precautions must be taken against attacks of mildew and injurious insects. Aphides, both black and green, play havoc with the plants, if allowed to infest the points of the shoots for any length of time.

The present is a good time to prepare a stock of plants of the early out-of-doors flowering varieties, of which Rycroft Glory, Madame Desgrange, and Gustave Grünerwald are types. It is not prudent to allow the roots of these varieties to remain in the open ground during the winter, they being liable to be killed by hard frost. I lift them in November, and store in cold frames, and early in the present month pull the roots in pieces, plant these bits in boxes filled with sandy soil, and return to the framer, protecting them from severe frost or too much rain, and nothing more. By the middle of the next month I plant them in the open ground. These varieties afford lots of bloom in September and the two following months. Strong cuttings may be struck at this season under hand-lights, placed within a cool-house. It is surprising what a large quantity of bloom is obtained from a well-grown plant of Rycroft Glory in the month of October. *E. Molyneux.*

being coral-red in colour, they are very attractive. It is a vigorous grower, and likes a rich loamy compost, a light position, and plenty of heat. It is a native of New Grenada, and was introduced in 1874.

BEONIAS.

A very free-flowering plant has for some time been in flower here, which is a cross between *B. hydrocotylifolia* and *B. manicata*. In habit the plant resembles the former parent, but has more vigour. The stems are creeping. The pinky-white flowers are borne well above the foliage, and they are strongly scented with a Boronia-like fragrance. It is an excellent winter-flowering plant, and has been in bloom here for more than a month. *Begonia Saundersi*, a bright red-flowering species, of small-growing habit, is another good plant, now commencing to bloom. Another early-flowering plant is *B. Paul Brnant*. There is a large specimen of this planted out here, which measures about a yard in height, and bears a mass of large clusters of flowers of a delicate pink colour. *Begonia President Carnot* has never ceased to bloom during the winter. The stems are now more than 6 feet in height; it is one of the best of the hybrid *Begonias*. The handsome *B. Gloire de Sceaux* is now coming into flower, and its large terminal clusters of flowers are very showy. The deep red foliage is also extremely handsome.

ROELLIA LILACINA.

When well grown this plant is useful, for stove decoration, and with careful attention to the pinching out of the longer growths during the growing season, shapely plants of about a foot or more in height may be obtained. The fleshy foliage is of a dark glossy green colour above, but paler beneath. The flowers are rosy-lilac, the lobes of the corolla being more than an inch across. These are produced during the early spring and summer months.

EUPOMATIA BENNETTII.

This small genus, embracing but two species, belongs to the order Anonaceae. *E. Bennettii* is a native of Australia, where it is stated in the *Botanical Magazine*, t. 4843, to grow in the woods and thickets in the colony of Port Jackson, especially in mountainous districts, and on the banks of rivers. Not only is the plant of botanical interest, owing to the peculiar structure of the flower, but the highly-coloured petal-like staminodes make it an effective decorative plant. Its habit is slender and bush-like, and the stems which spring from beneath the surface of the soil, bear oblong lanceolate alternate leaves, slightly undulated at their margin. The green hood-like calyx is thrown off by the opening of the flower, and the yellow or reddish staminodes appear at first eight to be petals. The stamens are reflexed, and completely covered by these staminodes. The plant is figured in the *Botanical Magazine* under the name of *E. laurina*, from a specimen flowered at Messrs. Henderson's Nursery, Maida Vale, in March of 1855, and it is still a rare plant in gardens.

OCHNA MULTIFLORA

Is a shrub-like stove plant, and bears fragrant yellow flowers. These are axillary, and although not individually very showy, are produced for a considerable time. The fruits have a red receptacle, and black carpels, and are very handsome. The foliage is serrate, and evergreen; and the plant is of slow growth. Its requirements are a warm, damp atmosphere, in a light position; and a light peaty soil, mixed with good loam, forms a suitable compost. *R. L. Harrow.*

£50 from the Crystal Palace Company; they acknowledge with thanks the presentation by Messrs. Benary, of Erfurt, of a Silver-gilt Medal in memory of the founder of the firm, Mr. Ernst Benary. This medal was, in accordance with the wishes of the donors, awarded to the finest exhibit. The "Turner Memorial" trustees gave a Silver Cup to be competed for; and the president, Martin R. Smith, Esq., for the fifth time gave £20 for border Carnations, shown as grown. This year's show will be held at the Crystal Palace on Wednesday, July 22.

The prize-list is considerably enlarged, and selfs and fancies, hitherto treated as one class, are divided into distinct classes, and receive the same recognition in the prize-list as bizarres, flakes, &c., a very proper sort of alteration, and one that will be welcomed by many cultivators of the flower.

A very useful recipe for destroying the destructive fungus, *Uromyces caryophyllinus* attacking Carnations, and employed with great success by Mr. F. W. Smith, of Villa Valetta, Cannes, is appended to the report.

The financial position of the Society should be very satisfactory to the members, the total income for 1895 being £401 16s. 7½d., the expenditure £205 19s. 1½d., leaving a balance in hand of £195 19s. 1½d.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 32° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

- 10, Ireland, S. \* Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending February 29, is furnished from the Meteorological Office:—

"The weather was fine and dry over England during the greater part of the week, and showery in Ireland and Scotland. Heavy rain fell, however, over the south and west of Ireland on Tuesday, and towards the close of the week unsettled conditions, with rain at times, extended to all parts of the Kingdom.

"The temperature was 2° or 3° below the mean in England, and 1° below in Scotland E. and W.; in Scotland, N., however, there was an excess of 1°, and in Ireland, of 2° or 3°. The highest of the maxima were recorded towards the end of the week, and ranged from 56° in England, S., and 58° in the Midland Counties and over Ireland, to 51° in Scotland, W., and 49° in Scotland, N. The lowest of the minima were registered on the 26th, when the thermometer fell to 15° in the Midland Counties, 17° in England, S., 19° in England, E., and to between 24° and 32° elsewhere.

"The rainfall exceeded the mean in Scotland, N. and W., Ireland, N., and England, N.W., but in all other districts there was a deficit. The fall in all the eastern and southern parts of England was very slight.

"The bright sunshine varied considerably in different parts of the kingdom, but was, as a whole, above the mean value in the south and east, and below it in the west and north. The percentage of the possible amount of duration ranged from 49 in the Channel Islands, 41 in England, S., and 35 in England, E., to 17 in England, N.W., 16 in Scotland, N. and E., and to 14 in Scotland, W."

NOTES FROM THE ROYAL BOTANIC GARDEN, EDINBURGH.

PITCAIRNIA COBALLINA.—This species is one of the brightest-coloured of the genus, and is a very handsome plant. The silvery foliage is 3 to 4 feet long, erect, and has spines towards the base. The flowers are produced upon racemes, the peduncles of which are bright red, and a foot or more in length. Comparatively speaking, the size of the flowers is large, and

SOCIETY.

NATIONAL CARNATION & PICOTEE.

ANNUAL REPORT FOR 1895.—The nineteenth annual report of this society is issued, from which we gather there has been a continuous and satisfactory increase of members, who now number upwards of 250.

The exhibition of 1895 was most successful, and the exhibition held at the Crystal Palace was the finest yet witnessed in this country. The society received a handsome donation of

THE DERBY HORTICULTURAL ASSOCIATION has been very usefully employed in an effort to secure more land for garden purposes in several convenient parts of the town.

DEVON ROSERY AND FRUIT-FARM, TORQUAY. The first annual meeting of the shareholders of Messrs. Curtis, Sandford & Co., Devon Rosery and Fruit-farm Amalgamated (Limited), Torquay, was held recently, Mr. J. N. Whitehead (Chairman of Directors) presiding.

MARKETS.

COVENT GARDEN, MARCH 5.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report.]

Table with columns for plant names and prices. Includes 'PLANTS IN POTS - AVERAGE WHOLESALE PRICES' and 'CUT FLOWERS - AVERAGE WHOLESALE PRICES'.

VEGETABLES. - AVERAGE WHOLESALE PRICES.

Table listing vegetable prices such as Asparagus, Beans, Cauliflowers, Cucumbers, Mint, Mushrooms, Onions, Potatoes, Seakale, Tomatoes, and Turnips.

Since last reports markets have become comparatively dead again, and virtually buyers control prices, which varies much.

SEEDS.

LONDON: March 4. - Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report rather more inquiry. Prices of Clover and grass seeds continue at a low level.

FRUITS AND VEGETABLES.

BOROUGH: March 3. - Quotations: - Savoy, 4s. to 5s. per tally; Brussels Sprouts 2s. to 2s. 6d. per bushel; Onions, 4s. to 5s. per bag; Carrots, 1s. 9d. to 2s. 3d.; and Turnips, 2s. to 2s. 6d. per dozen bunches; Horseradish, 8s. to 12s. per dozen rolls; Apples, 4s. to 6s. per bushel.

SPITALFIELDS, March 3. - Quotations: - Brussels Sprouts, 1s. 6d. to 2s. per bushel; Kale, 9d. to 1s. do.; Broccoli, 9d. to 1s. do.; Turnip-tops, 1s. 6d. to 2s. per bag; Savoy, 2s. to 3s. per tally; Leeks, 1s. to 1s. 6d. per dozen; Onions, spring, 2s. to 2s. 6d. per dozen bunches; Rhubarb, 1s. 6d. to 2s. per dozen bundles; Seakale, 8d. to 9d. per bundle; Horseradish, 10d. to 1s. do.; Parsley, 1d. 6d. to 2s. per dozen bunches; Celery, 1s. 3d. to 1s. 6d. per dozen; Onions, bags, 2s. to 3s.

STRATFORD: March 3. - The improved clearances in the week ending 25th ult. have been fully maintained during the past week, and a fair trade has been done at undermentioned prices: - Savoy, 2s. 6d. to 3s. 6d. per tally; Greens, 1s. to 1s. 6d. per bag; do., 1s. to 1s. 6d. per dozen bunches; Cauliflowers, 1s. to 2s. per dozen; do., 7s. to 8s. per tally; Carrots (household), 23s. to 28s. per ton; do., cattle feeding, 20s. to 21s. do.; Parsnips, 4d. to 6d. per score; Mangels, 12s. to 15s. per ton; Swedes, 14s. to 17s. do.; Onions, Bordeaux port, 5s. to 5s. 6d. per case; Apples, English cookers, 3s. to 4s. per bushel; do., dessert, 3s. to 4s. do.; do. Nova Scotian, 12s. to 15s. per barrel; Scotch Kale, 3d. to 9d. per sieve; Beetroot, 4d. to 6d. per dozen; Horseradish, 1s. to 1s. 2d. per bundle; Parsley, 1s. 1d. to 1s. 6d. per dozen bundles; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Rhubarb, forced, 1s. to 1s. 3d. per dozen bundles; white Turnip, 1s. 3d. to 1s. 9d. per bag.

FARRINGTON: March 5. - Quotations: - Cauliflowers, 1s. 9d. to 2s. per bushel; Broccoli, 1s. per bushel; Sprouts, 2s. to 5s. per half-bushel; Celery, 2s. 6d. per roll; Leeks, 1s. 6d. per dozen; Turnips, 2s. per dozen bunches; Carrots, 2s. 6d. do.; Greens, 1s. 3d. to 2s. per bushel; Savoy, 5s. per tally; Onions, 2s. per bag; spring, do., 2s. 6d. per dozen bunches; Parsley, 2s. 6d. do.; Turnip-tops, 1s. 3d. per bushel; Kale, 1s. do.; Seakale, 1s. 2d. per punnet; Cucumbers, 12s. per dozen; Mushrooms, 7s. per half-bushel; Apples, Nonpareils, 16s. per barrel; Baldwin, 15s. do.; Greenings, 15s. do.; Victoria, 15s. do.; Russets (No. 1), 20s. do.

POTATOS.

BOROUGH: March 3. - Quotations ranged from 40s. to 90s. per ton.

SPITALFIELDS, March 3. - Quotations: - High lands, Main Crop Kidneys, 40s. to 60s.; Bruce, 40s. to 55s.; Giants, 45s. to 65s.; Hebrons, 50s. to 70s.; Drones, 50s. to 60s.; Saxons, 70s. to 90s. Black lands, Bruce, 35s. to 40s.; Giants, 30s. to 40s.; Magnams, 35s. to 40s.; Scotch Main Crop, 50s. to 65s.; Bruce, 45s. to 55s. per ton.

STRATFORD: Mar. 3. - Quotations: - Dark soil Bruce, 30s. to 35s.; do. light, 40s. to 45s.; Reading Giants, 35s. to 50s.; Sutton's Abundance, 45s. to 60s.; Scotch Main Crop, 40s. to 60s.; Dunbar Magnams, 80s. to 85s. per ton.

CORN.

Averages. - Official statement of the average price of British Corn, imperial measure (qr.), for the week ending February 29, and for the corresponding period last year: - 1896: Wheat, 25s. 6d.; Barley, 21s. 10d.; Oats, 13s. 10d. 1895: Wheat 19s. 10d.; Barley, 21s. 9d.; Oats, 14s.

HAY.

Averages. - The following are the averages of the prices at the metropolitan markets during the past week: - Clover, prime, 65s. to 87s. 6d.; inferior, 35s. to 69s.; hay, best, 50s. to 85s.; inferior, 30s. to 55s.; mixture, 60s. to 84s.; and straw, 20s. to 40s. per load.

ENQUIRY.

A. BATEMAN wants to purchase a plant of Othonna (Othonopsis) chaerifolia, and would some reader of the Gardeners' Chronicle kindly state where he can obtain it.

NOTICES TO CORRESPONDENTS.

ARALIAS: E. James. Graft in a close case in the propagating-house on bits of the root of Aralia epinosa, or on the stems of A. goffoyei. This may be done in April after natural growth has commenced, or in August.

BOOKS: T. A. C. A Manual of Orchidaceous Plants, by J. Veitch & Sons, Royal Exotic Nursery, 544, King's Road, Chelsea, S.W.; Orchid Grower's Manual, by B. S. Williams, published at Victoria and Paradise Nurseries, Upper Holloway, N. - A Constant Reader. Henfrey's Elementary Course of Botany, published by Jan Van Voors, Paternoster Row. - C. Abbott. The Gentlewoman's Book of Gardening, published by Henry & Co., Bouverie Street, London, E.C. - L. Maurer, Jena. The Gooseberry Grower's Register is published by Messrs. Charles Leicester & Sons, Park Lane Nurseries, Macclesfield, and can be had from them, price 1s. 2d.; probably you can obtain back copies from this firm, as they have had the publication of it for some time past. It gives reports of a number of Gooseberry shows held during 1895, and as they may be regarded as fixed shows, you will be able to gather from the Register the places and dates of the several exhibitions; those which are held are mainly in Lancashire, Yorkshire, Cheshire, and Derbyshire. You may succeed in obtaining from Messrs. C. Leicester & Sons a copy of the rules of the leading Gooseberry show, and in addition, the modes of procedure at such an exhibition, which are full of interest.

CALYX AND SEPAL: Jack. The calyx is usually green and foliaceous, but in such flowers as the Anemone it becomes petaloid. The leaves of the calyx are called sepals. In the Fuchsia the calyx is absent.

CARNATIONS WITH DISEASED LEAVES: W. A. C. Both numbers sent are suffering from the same disease, the difference in appearance being due to different stages of development of the fungus, Helminthosporium echinulatum, Berk. The mature spores are very abundant on the specimens sent, and the rapid spread of the disease is due to their being conveyed from one plant to another by wind, rain, and other causes. This disease, which is very common on all cultivated plants of the Pink family, is easily checked, if the plants are sprayed with a solution of permanganate of potash of a deep rose-colour when the disease first appears. Your plants are in such a bad state that it is doubtful whether they can be saved. Try spraying with Bordeaux Mixture, or twice a week with a deep red solution of potassium permanganate, spraying the ground also. If you happen to have any plants not yet diseased, spray those also, if you wish to save them; and in future spray as a preventative of the disease, and not have to do it as a cure. G. M.

COTONS AND DRACENAS: E. James. "Ringing" is not much practised, unless in the case of a Dracena with a large head of foliage, which it is desired to lower without loss of leaves.

CUCUMBER: C. B. W. & Co. The appearance resembles the "rust" of grapes, and may be due to similar causes - sulphurous emanations from the hot-water pipes, or draughts of cold air touching the fruit when moist and warm.

CYRIPEDIUM INSIGNE: E. James. They will live in the cold greenhouse, but do better in the intermediate-house.

GREENHOUSE PLANTS FOR EXHIBITION: C. H. W. You would do well to include Bignonia Tweediana, Aphelxia macrantha purpurea, Azalea indica varieties, Bougainvillea glabra, Erica in early or late-flowering varieties, as required; Lapageria rosea and L. r. alba, Tremandra verticillata, Tetra-theca ericeifolia, Epacris in variety, Boronia Drummondii, Chorozema Lawrenceana, Statice Gilberti, &c. We are positively unable to give the necessary culture of these plants in this column, as the space is inadequate; but the cultivation of plants for exhibition, as well as for garden purposes, is given periodically in "Plants under Glass" column in our weekly Calendar. Consult this from the commencement of the year, and onwards.

**HYACINTH: D. and D.** The peculiarity seen in the specimen of Hyacinth sent is one of those freaks which flowers occasionally (and especially double flowers which are abnormal), exhibit. It may have been induced by some check in the growth, or some incident in the ripening, but the actual cause cannot well be named.

**LÆLIA ANCEPS: R. C., Filey.** The peculiarity in your *Lælia anceps* flower arises from the petals, by accident in the expanding, getting inside instead of outside the lateral lobes of the lip. Next time of flowering you will most likely find it come in the ordinary way. If not, we should like to see it again. The rose-coloured *Pelargonium* should make a fine pot plant, if not a bedder.

**MARÉCHAL NIEL ROSE-GROWING IN A FLOWER-POT: M. Niel.** The variety succeeds out of doors either in an open border or planted against a wall or trellis, only the position must be a warm one. Prepare the soil by manuring and trenching it, and be sure that the drainage is sufficient. Begin by loosening the roots, a nucleus may be left intact, and having noted the length of the longest make a hole 8 to 6 inches deep, and as wide as will accommodate them when spread out radially, proceed to plant them at various depths up to 2 inches from the surface, throwing some light sandy soil, Mushroom-bed dung, &c., over them, and then some of the etaple. If planted against a wall, the stem at the ground-level should be distant from the face of the wall about 4 inches. Finish off with the soil somewhat higher than the surrounding level, and be sure to make the entire bed or station very firm by treading it, before proceeding to plant, as well as afterwards. It is well to afford the roots a heavy watering with a watering-pot minus the rose, before the hole is quite filled in. If your land is light apply a mulch of short horse-dung. Pruning for this season may be done in April, when renewed activity is remarked, entirely cutting out all the weak and severely shortening back strong growths. If the crop of flowers showing in any one year is a heavy one, the plants should receive during May, June, and July two or three heavy applications of liquid-manure, not much diluted. If you treat *M. Niel* as a bush in the open, being a rather vigorous grower, it will need ample space—say 4 feet from plant to plant.

**MONEY WORT: R. P.** The plant *Lysimachia Nummularia*, called variously Creeeping Jenny, Herb Twopence, Springs of Sovereigns, Wandering Sailor, is indigenous to the more southerly parts of England, but is not found wild in Scotland or Ireland. Propagation by division.

**NAMES OF FRUITS: Wm. Higgin, Stanwick.** 1, Bismann's Red Winter Reinette; 2 and 5, Dutch Mignonne; 3, Waltham Abbey Seeding; 4, Hildburghary.—*E. H., Ascot.* 1 Lane's Prince Albert; 2, Bedfordshire Foundling; 3, Northern Greening; 4, Royal Russet; 6, Dutch Mignonne.—*Q. L., Scarlet Russet.*—*Hogg & Robertson.* Seems to be Blenheim Orange, much braided.—*Charles Eastell, Ilford.* Brabant Belle fleur.—*A. Sewell.* Flower of Kent.—*W. Camm.* The fruit sent is long past its best, and cannot, therefore, be named.

**NAMES OF PLANTS: P. C., Cypripedium insigne.** It may be of an importation sold as *C. insigne montana*, a name which means nothing in itself, although some very fine varieties have flowered out of the importation.—*J. A.* Both varieties of *Cypripedium barbatum*.—*J. T. A., Lonicera chrysantha.*—*G. B., Shrewsbury.* 1, *Dendrobium chrysetoxum*; 2, *D. thyrsiflorum*; 3, *D. Devonianum*; 4, *D. Falconerii*; 5, *D. suavisimum* probably, but the flower was decayed. Some of the tickets had also got detached.—*C. L. S., Aërides vandarium*, illustrated in the *Gardeners' Chronicle*, Nov. 14, 1885, p. 629.—*A Constant Reader.* 1, *Clerodendron speciosum*; 2, *Anthurium Scherzerianum*; 3, *Nerium Oleander*; 4, *Lasiandra macrantha*.—*Eric James.* 1, *Sedum spectabile*; 2, *Daphne indica*; 3, *Eunomia japonica areo-marginata*; 4, *Begonia argyrostigma*; 5, *Metrosideros floribunda*, probably; 6, possibly *Veronica Andersonii*: send when in flower.—*P. H. and W. P., Cornus mas.*—*H. H. H.* The leaf is that of *Chrysothylum (Theophrasta) imperialis*. Fruits next week.

**NOTICE TO QUIT: Foreman.** We think that you are entitled to one month's notice, or money in lieu thereof, and compensation for loss of house and garden, which you obtain in part payment for services rendered.

**ORCHID: F. De Last.** Your Orchid is suffering from disease, which has given much trouble to growers lately, and for which no cure has as yet been discovered.—*H. D., Leeds.* The damage to the Orchid leaves might have been caused by direct heat from the hot-water pipes, or from a sudden fall in the temperature, or from any other cause which would produce a harmful check. Such appearances are common in badly-ventilated houses.

**PEACH SHOOTS INFESTED WITH INSECTS: Arlington, Barnstable.** As far as we are able to discover, the pest you are bothered with is the black aphid, common to Peach trees. There appears to be no beetle on the specimens sent, but plenty of aphides. We have never known the old remedy of syringing the trees with, or dipping infested shoots in, diluted tobacco juice, ineffective when taken in time. Of course, this could not now be done until all the blossoms have set; but you might use Richards' XL All Vaporiser. The fumes of this will assuredly kill the aphid, and will not injure the blooms.

**PINK COLOURED MARÉCHAL NIEL ROSE: R. T.** Undoubtedly a sport from the yellow-coloured variety, and well worthy of propagation.

**POTATO LECTURE: J. H.** The paper read by Mr. A. W. Sutton before the Royal Horticultural Society, was given in *Gardeners' Chronicle*, Nov. 2, 1896, p. 527.

**PRUNING OLD RHODODENDRONS: W. C.** It is quite safe to prune them as severely as you think necessary, the plants breaking out thickly from all parts of the old wood. It would be prudent to plant or sow seeds of quick-growing subjects among them, so as to restore in part the shade the plants will be bereft of, and give a furnished appearance; this being done for two seasons.

**RICHARDIA FLOWERS: Jack.** These are found on the spadix, and are small and numerous.

**RICHARDIA WITH LEAFY SPATHES: H. B.** The specimens of spathe sent show how close is the relationship of leaves to spathe and flowers; and such departures from the normal are very likely to occur when there is extraordinary vigour in the plants, as in this case.

**SEEDLING CARNATION: J. D.** An excellent flower; full, regular florets, broad and round; colour pleasing and calyx good.

**SIX FLOWERING PLANTS FOR A STOVE, AND SIX FOR THE GREENHOUSE: An Old Subscriber.** For the stove select as plants of climbing habit *Dipladenia amabile* and *Stephanotis floribunda*; *Eucharis grandiflora*, *Franciscea calycina major*, *Tuberose montana coronaria flore pleno*, *Pteroma elegans*. For the greenhouse, *Azalea indica Deutsche Perle*, if a white one is liked, or *Dac de Nassau*, *Camellia imbricata alba*, *Bronia megastigma*, *Acacia Drummondii*, *Boavardia* any variety, *Chorez-ma varium*, and *Clivia miniata*.

**SIX FOLIAGE PLANTS FOR STOVE: An Old Subscriber.** *Acalypha Macraeana*, *Alocasia Lowii*, *Aparagus plumosus*, *Cissus discolor*, *Codiaeum (Croton) Weimanni*, *Strobilanthes Dyerianus*.

**SIX GREENHOUSE FOLIAGE PLANTS: An Old Subscriber.** *Aralia Sieboldii*, *Aspidistra lurida variegata*, *Coprosma Baucriana variegata*, *Dracena congesta*, *Ficus elastica albo-variegata*, *Lomaria ferruginea*.

**SPHLEA JAPONICA: J. H.** The collapse of your forced plants is either due to deficient establishment at the root, or the use of strong manure, probably the former. At the least, you might have afforded us an account of your mode of treatment.

**STANUOPEAS: E. James.** The plants require baskets with good-sized apertures in the sides and bottom, through which the flower-spikes can protrude.

**TENERIFFE AS A MARKET GROWER'S FIELD OF OPERATIONS: Hortus.** There should be good openings in the cultivation of early produce, such as Potatoes, Onions, Tomatoes, Oranges, Pine-apples, with some amount of glass protection; Limes, Lemons, Guavas, and similar products, that are capable of being shipped without spoiling. But no one should go there with the idea of starting in business, without first visiting the island.

LLOYD'S PERFECTED  
**'Pennsylvania'**

AMERICAN  
LAWN-MOWER.

"We strongly recommend the 'Pennsylvania,'"—*Field.*

World's Fair, Chicago, Highest Award.  
Paris International Exhibition, Highest Award, Silver Medal.  
NO AWARD WAS GIVEN to any English or Continental-made Lawn Mowers.

THE "PENNSYLVANIA"

IS THE  
Perfection of EASY WORKING and EFFICIENCY.

The ONLY AMERICAN LAWN MOWER fitted with Six Cutting Blades.

THE "PENNSYLVANIA"

IS THE  
MACHINE

FOR  
GOLF LINKS.

Above illustration shows the machine as it appears when OUT OF GEAR, and in the proper position for running it easily from one place to another, over gravel walks or rough and uneven ground. When moving it in this way there is no unnecessary wear of the driving pinions, all risk of damaging the cutting knives is avoided, and the machine can be pushed over the ground with very little labour—a great advantage in extensive gardens, but especially on GOLF LINKS.

Gardeners who have once tried the "Pennsylvania" Lawn Mower, will use no other.

THE "PENNSYLVANIA."

CARRIAGE PAID TO ALL STATIONS.  
THE "PENNSYLVANIA."

ONE MONTH'S FREE TRIAL ALLOWED.

TESTIMONIAL—  
"World's Columbian Exposition,  
Chicago, October 16, 1893.

"Gentlemen,—I desire to state that we have used the 'Pennsylvania' Lawn Mowers almost exclusively during the progress of the Fair, with the most satisfactory results. The ease in working them was remarkable, and they did more work than we supposed was possible for Lawn Mowers to accomplish. The appearance and condition of our lawns, in comparison with others, prove the high grade and superiority of these Lawn Mowers.—A. B. FARQUHAR, Executive Commissioner."

THE MOST SUITABLE FOR SHADING ORCHIDS, FERNS, Palms, and Stove and GREENHOUSE PLANTS.  
 It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading.  
 It with-stands better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchid and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used.  
 Blinds made up and fixed complete.  
 Sold in pieces, 30 yards long by 1 1/2 yard wide. Price 4/6, each. Samples submitted gratis.  
**B. S. WILLIAMS & SON,**  
 Victoria and Paradise Nurseries,  
 UPPER HOLLOWAY, LONDON, N.

**WILLIAMS' HOTHOUSE SHADING.**

THE SEASON has AGAIN COME ROUND FOR USING  
**RICHARDS' XL ALL WEED DESTROYER.**  
 To be used in the proportion of 1 gall. to 25 galls. of water.  
 One of the greatest economisers of labour and expense in the Garden and Park. No disturbing the gravel and solidity of the Garden Walks and Carriage Drives. Simply apply it once a year and banish all weeds for the season.  
 Full directions for use printed on every package.  
 In strong iron drums 2 gallons, 3s. 8d.; 4 gallons, 7s.; 6 gallons, 10s. In casks, 12 gallons, 18s. 6d.; 18 gallons, 27s. Barrels of 50 gallons, 50s.  
 Four or more gallons sent carriage paid to any part.

14 " ..	0 8 0	25 " ..	0 13 6

##### AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, 28; Half Page, 44 10s.; Column, 23.

**GARDENERS AND OTHERS WANTING SITUATIONS.** 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

**POSITION.**—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

**NOTICE TO ADVERTISERS.**—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

**POSTAL ORDERS.**—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

**BEESSON'S MANURE, SHEFFIELD.**—For Vines, Plants, and Vegetables. Sold with a Guaranteed Analysis. Has stood the test of the principal growers for over 20 years, and is admitted to be the Best for all Horticultural Purposes. In boxes, 1c. and 2s. 6d.; bags, 50 lb., 8s.; 1 cwt., 15s. May be obtained through any Seedsman; or, direct (bags only), carriage paid, and liberal discount for cash with trial order, from W. H. BEESSON, SHEFFIELD. Pure Crushed Bones, all sizes, and other Fertilisers at market prices.

## THOMSON'S VINE AND PLANT MANURE.

## XL ALL LIQUID INSECTICIDE,

(PATENT),

For Syringing, Dipping, and Washing Plants and Fruit Trees.

Manufactured in Bond, from pure Nicotine of Tobacco, by special permission of the Hon. Board of H.M. Customs.

### ADVANTAGES CLAIMED—

It is always of uniform strength, and perfectly safe when used as directed. Kills every insect which affects Plants and Fruit Trees. Does not stain Foliage, Flowers, or Fruit. A clear Liquid (no sediment), herein differing from the crude, thick, soapy preparations frequently recommended. Being the Strongest in the Market, it is cheap in use, standing twice the amount of dilution of any other safe preparation. As an example, Kills Fly at 1 to 40 parts of water.

1 Pint, 2s.; 1 Quart, 3s. 6d.; 1 Gallon, 5s.; 1 Oallon, 10s.; also in 4 and 6-Gallon Drums.

To be had from all Nurserymen, Seedsmen, and Sundriesmen or direct from the Manufacturer and Patentee—

G. H. RICHARDS,  
Old Shot Tower Wharf, Lambeth, London, S.E.  
Telegraphic Address: "Vaporizing, London."

For destroying Insects on Plants. Used by every Orchard Grower of any note all over the World.

### THE CHEAPEST and BEST.

Half-pints 1/8, pints 2/6, quarts 4/6, half gallons 7/6, gallons 12/6, 5-gallon Drums 10/6 per gallon.

Carriage Paid.

E. G. HUGHES, Victoria Street, MANCHESTER.

Sold by all Seedsmen. Pamphlets free on application.

A SIXPENNY BOTTLE will MAKE a GALLON of DELICIOUS WINE.

Sample Bottle post-free for 9 Stamps.

A LADY writes: "The 6d. bottle of Ginger Wine Essence made several bottles of most delicious wine, far better than what we have paid 2s. a bottle for. It is most suitable for children's parties."

**NEWBALL & MASON, NOTTINGHAM.** MASON'S EXTRACT OF HERBS, for making delicious Non-intoxicating Beer. A 6d. bottle makes 8 gallons. Sample bottle, 9 stamps; or a sample of both, post-free, for 15 stamps.

### JOSEPH BENTLEY,

CHEMICAL WORKS, BARROW-ON-HUMBER, HULL.

## LETHORION (Vapour Cone)

PATENT.

The total destruction of Insect Pests in Green-houses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. IT CANNOT fail where the houses are secure. Red Spider, Scale, and Mealy Bug can be easily eradicated by doubling the Cone power.

PRICES: For frames, &c., of 50 to 100 ft., 6d.; 50 to 700 ft., 9d.; 1 60 to 1500 ft., 1s.; 4000 ft., 3s. 6d.

The public are cautioned against imitations in various forms at less cost, as they have in most instances proved to be worthless articles, totally unequal to Lethorion in strength and effect.

# GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH"

## ROLLING AND COLLECTING MACHINES FOR 1896.

The Winners of every Highest Prize in all cases of competition, and the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.  
 HER MOST GRACIOUS MAJESTY THE QUEEN on numerous occasions,  
 HIS ROYAL HIGHNESS THE PRINCE OF WALES,  
 THE KING OF THE BELGIANS.

The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,  
 And most of the NOBILITY, CLERGY, and GENTRY of the United Kingdom.

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

Upwards of 220,000 of these Machines have been Sold since they were first introduced in the year 1856.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

**SINGLE-HANDED SILENS MESSOR LAWN MOWER.**  
 With Improved Steel Chains, Wheels, and Handles.

To cut 6 in., can be worked by a Lady ... £1 15 0  
 To cut 8 in., do. do. ... 2 10 0  
 To cut 10 in., do. by a strong youth ... 3 10 0  
 To cut 12 in., do. by a man ... 4 10 0  
 To cut 14 in., do. do. ... 5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

BEWARE OF DECEPTIVE IMITATIONS.

### DOUBLE-HANDED LAWN MOWER.

## NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, consequent on the large increase in the circulation, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

**ASTER AND STOCK SEED.**—It is much to be regretted that every lover of the above have not afforded themselves the pleasure of seeing, and making an inspection, of our acres of these when in their full beauty; we give the assurance that all we have grown during the past eight years have been from our own Eynford saved seed. Our new variety of Aster, Eynford Yellow, is acknowledged a great acquisition. We ask all interested in these glorious flowers to send for our Catalogue containing full particulars of these and all other kinds of flowers of equally superior quality. Post-free.

H. CANNELL AND SONS, Swanley, Kent.

**CARNATIONS! NEW MALMAISONS!** JAMES DOUGLAS, the noted Carnation Specialist, is now sending out plants, well established in pots, from his unrivalled collection of 20,000 plants. **CARNATION SEED**—Saved from the best named varieties at Bookham, 1s. 6d. to 2s. 6d. per packet. Catalogues on application.—Great Bookham, Surrey.

Well-grown PALMS. FRUIT TREES to name.

A collection of HARDY BULBS.

BORDER PLANTS in variety. LILIUMS from Japan.

**MR. J. C. STEVENS** will sell the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, March 18, at half-past 12 o'Clock precisely.

On view morning of Sale, and Catalogues bad.

**THURSDAY NEXT.**

**LINDEN'S GREAT ORCHID SALE.**

A GRAND INTRODUCTION OF

**A NEW AND MAGNIFICENT TYPE OF CYPRIPEDIUM.**

**MR. J. C. STEVENS** will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, March 19, a grand new CYPRIPEDIUM, by order of Messrs. Linden, who have great pleasure in introducing this new Orchid, just received from their Collector in the Malay Archipelago, to hand, per *Messageries Maritimes*, in splendid order.

This should prove one of the most sensational introductions of late years. Our Collector, who had the good fortune to discover this new species, after almost superhuman efforts in an Island which is devoid of every trace of civilisation, pronounces it to be the grandest Cyrtopodium he has ever seen, with flowers of great size, elegant shape and striking beauty. Some wonderful forms may turn up amongst these plants, which look very distinct.

On view morning of Sale, and Catalogues bad.

**Thursday Next, March 19.**

By Order of Messrs. Linden, Brussels.

An importation just received in grand condition of:—

The true OLD CATLEYA LABIATA, synonym CATLEYA WABOCQUEANA, Linden's unsurpassable and unrivalled type. Universally acknowledged as producing the grandest and most brilliant forms of this, the true old autumn-flowering Catleya Labiata.

CELOGYNE VIRGINALE (provisionally named)—A new Burmese species, described by collector as producing beautiful large white blossoms, in the way of Ceogyne cristata, of a delicious fragrance. Just to hand in very fine condition.

MILTONIA MORELIANA, var. ATRO-PURPUREA — A magnificent lot in very fine condition of this North Brazil variety.

BULLINGTONIA LINDENI.—The grandest and freest-flowering of all. In superb condition.

CATLEYA SPECIES. Supposed Natural Hybrids. Selected semi-established unflowered plants. They have been collected in the same regions from whence we introduced the famous Catleya Leopold II, and other grand forms, as Catleya Hardyana Linden, C. Hardyana Dallemagni, C. Hardyana Luciani, and others.

CATLEYA REX.—Selected established unflowered plants, of this the grandest of all Catleys.

ODONTOGLOSSUM VEXILLARIUM, Linden's famous type. —Superb selected unflowered plants, fine, healthy established plants, with strong flower-spikes, producing the largest-flowered and darkest-purple forms ever introduced.

Together with many other valuable IMPORTED AND ESTABLISHED ORCHIDS.

**MR. J. C. STEVENS** will sell the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, March 19, at half-past 12 o'clock precisely.

**MONDAY, MARCH 23.**

**SPECIAL COLLECTION OF BORDER PLANTS.**

**MR. J. C. STEVENS** will sell the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, March 23, at half-past 12 o'Clock precisely.  
On view morning of Sale, and Catalogues bad.

**Thursday, March 25.**

The Somerhill Collection of Established Orchids.

**MR. J. C. STEVENS** has received instructions from the Executors of the late Sir Julian Goldsmid, Bart., of Somerhill, Tonbridge, to offer for SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, March 25, at half past 12 o'Clock precisely, the valuable and well-grown Collection of ESTABLISHED ORCHIDS, including, amongst other choice things—

- |                              |  |
|------------------------------|--|
| Cattleya Mossie: Reineckiana | Odontoglossum vexillarium              |
| " Wagneri                    | Cobbianum                              |
| " exoniensis                 | Lycaste Skinneri Imperator             |
| Dendrobium glumaceum         | Ceogyne cristata alba                  |
| " validum                    | Dendrobium nobile albiflorum           |
| Dian Vetchii                 | " Cooksonii                            |
| Vanda teres                  | Vanda Sanderiana (Goldsmid's variety)  |
| Thunia Veitchii              | Lelia tenebrosa (extra good varieties) |
| Lelia Gouldiana              | " anceps (do do.)                      |
| Ceogyne Dayana               | Anthurium Le Flambeau                  |
| Anthurium Andreanum          | " album                                |
| " album                      | " Laingii                              |
| " Ferrierense                | " rotundispatum                        |
| Odontoglossum Uro-Skinneri   | " &c. &c.                              |

On view morning of Sale, and Catalogues bad.

### EVERYONE

Who is interested in the selection of the best New Mums, or the best Exhibition Varieties, as given in *Journal of Horticulture*, Feb. 21.

### SHOULD READ

A very small book which tells you a lot of the wants and the tricks of the Mum; And if you should doubt it, then buy one as proof, And see how the business is done.

The price is so small, and there's something for all, As you'll find from the very beginning; Tells what to be done for the Chrysanthemum, And all for the price of a shilling.

### WELLS' BOOK ON "MUMS."

Post free from the Author, 1s. 2d., or from any Bookseller. WELLS' CATALOGUE gives the name, description, and price of nearly every one mentioned in the *Annals of Horticulture*, Post free from—

**W. WELLS, REDHILL, SURREY.** Farlowood Nurseries.

# WHEELER'S ALDERMAN POTATO.

For exhibition this Potato is a model, the eyes are shallow, the skin rough; it is of large size, a great cropper, and of the finest possible quality; it withstands disease well, and is one of the most profitable Potatoes to grow. The tubers will stand cutting freely.

Price 3s. per peck; 10s. 8d. per bushel (56 lb.).

In order to extend the knowledge of this valuable Potato, we will forward a sample of 2 lb. post free on receipt of one shilling.

I cannot speak too highly of your ALDERMAN POTATO. I had plenty of tubers 1 1/2 lb. in weight, and they cooked very dry and white.—W. H. FREETH.

Your ALDERMAN POTATOS were very good indeed. I weighed one of the largest, and it turned the scale at 2 lb. 3 oz. I never had such Potatoes before.—HY. MORGAN.

Your ALDERMAN POTATO is a splendid one.—MAJOR C. BROWNE.

Last year's produce of the ALDERMAN POTATO was excellent. We are eating them now every day, and often remark their goodness.—H. W. LIVETT.

I am specially pleased with the ALDERMAN POTATO, and consider it one of the most valuable introductions.—J. H. FRY.

From 7 lb. of your ALDERMAN POTATOS I raised 3 cwt.; for size and cooking quality nothing can surpass them; many weighed 1 1/2 lb. each, and one extra large one being 2 lb. 2 oz.—JOHN CLUTTEBRUCK.

Numerous other testimonials, copy of which may be had gratis and post free on application.

**I. DAVIES & SON,**  
BROOK LANE NURSERY, ORMSKIRK.

**NEW CHRYSANTHEMUMS.**

I have much pleasure in drawing attention to the Five New Varieties I am sending out this season, raised by Mr. Chas. E. Shea, whose aim it has been to raise quality rather than quantity, and this is proved by the fact that Seven Varieties out of Nine of his raising have received First class Certificates. No other raiser, English or Continental, can show anything like this record. This speaks for itself, and the varieties I have much pleasure in offering will require no florid description to ensure them a good reception from every exhibitor:—

- AMY SHEA ... .. 5/- each.
- FALORIA ... .. 5/- each.
- MAGGIE SHEA ... .. 7/6 each.
- MARJORY KINDER ... .. 5/- each.
- OLGA LEICHMANN ... .. 5/- each.

Highest Class Workmanship. Photos and full particulars on application to

Gloucester Railway Carriage & Wagon Co., Ltd., GLOUCESTER.

**THE MOST SUITABLE FOR SHADING ORCHIDS, FERNS, Palms, and Stove and GREENHOUSE PLANTS.**

It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light attainable through shading. It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchid and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used.

Blinds made up and fixed complete. Sold in pieces, 30 yards long by 1½ yard wide. Price 40s. each. Samples submitted gratis.

**B. S. WILLIAMS & SON,** Victoria and Paradise Nurseries, UPPER HOLLOWAY, LONDON, N.

**IMPORTANT SALE, THURSDAY Next, MARCH 19.**

A GRAND INTRODUCTION OF A NEW AND MAGNIFICENT TYPE OF  
**CYPRIPEDIUM.**

**MESSRS. LINDEN** have great pleasure in including in their Great Sale on THURSDAY NEXT, this Grand Introduction, just received from their Collector in the Malayan Archipelago, to hand per "Messageries Maritimes," in Magnificent Order. This should prove one of the most sensational Introductions of late. Our Collector, who had the good fortune in discovering this New Species, after almost superhuman efforts, in an Island which is void of every trace of civilisation, pronounces it as the **GRANDEST CYPRIPEDIUM** he has ever seen, with flowers of very great size, elegant shape, and striking beauty. Some wonderful forms may turn up amongst these plants, which look very distinct indeed.

DEMAND CATALOGUE, with FULL PARTICULARS, at

**CLIMBING  
FRENCH BEAN,  
SUTTON'S  
TENDER AND TRUE.**

In 1891 the Royal Horticultural Society acknowledged its merits by the award of a First-class Certificate, and in the second year's trial at Chiswick the Committee were so impressed with its value, that they again gave it the highest possible award, viz., three crosses (xxx). On August 16, 1895, when inspecting the Chiswick trials, the previous awards were confirmed by the authorities.

"TENDER AND TRUE RUNNER BEAN.—The public ought to be greatly indebted to Messrs. Sutton & Sons for the introduction of this splendid novelty. Canadian Wonder sown at the same time is all over. Tender and True is covered with well-shaped pods about the size of those of Canadian Wonder, and is likely to continue cropping until frost cuts it down.—R.—" *Journal of Horticulture.*

Price 3s. per Quart.

SATURDAY, MARCH 14, 1896.

THE FLOWER GARDEN.

IN laying out a flower-garden, and pleasure-grounds adjoining, due regard must be paid to the style of architecture and the size of house as well as to the immediate surroundings, so as to insure the former being in keeping with the latter. Whether the mansion be of large or small dimensions, old or modern in style, the garden should harmonise with it.

A sunk Italian-garden should be bounded with Yew hedges at the base of the terraces, and enclosed by ornamental walls covered with Ivy, and surmounted by piers capped with stone balls at short intervals. A broad gravel walk should run lengthwise through the centre of the enclosed space, with narrower ones communicating therewith at ends and sides, and at various other points, thus dividing the intervening spaces into squares, and again dividing these squares into a series of geometrical figures. Each bed in the design should have a strip of green sward intervening between gravel-walks of the same width (22 inches), together with suitable statuary judiciously placed, and a fountain occupying a central position, is quite in keeping with a modernly-built house, and being sunk, terraced, &c., it does not obstruct or otherwise interfere with the view and beauty of the surrounding landscape—indeed, on the contrary, it forms quite an exclusive picture in itself; the large breadths of green sward of irregular outline, which generally adjoin and extend some distance beyond the Italian-garden, lend additional charm and contrast to the floral picture.

A suitable site for a flower garden is a place of rather circumscribed prospect, limited almost to the green sward out of which the flower-beds are cut, with a liberal area of lawn on either side and beyond, with here and there specimens of the common and Purple Beech, flowering shrubs, and specimen Conifers, together with beds and borders of indefinite shape and width, planted with flowering shrubs, Thorus, &c., of various heights and periods of flowering, belts of trees or wooded slopes terminating the view in the near distance, thereby concentrating attention on the intervening space—the flower garden. This is generally situate opposite the south front of the mansion, villa, or cottage, sometimes extending a little to the east and west, according to local circumstances, by which the selection of aspects and sites is necessarily governed. As an instance of this, I may here remark, in passing, that one of the most extensive and beautiful flower gardens that I am acquainted with in the United Kingdom faces due north and east of the court, the ground sloping sharply from terraces to beds of shrubs and trees of Pine-wood, &c., through which (eastward) is a vista extending to a range of mountains some 40 miles distant, while the surface on the north side extends

acutely for a distance of about 400 yards to a ha-ha (sunk fence), with an ornamental railing, and a gate and bridge in the middle, running parallel with it, and a broad gravel-walk, with which a broad central, and various narrower walks communicate. And beyond this ha-ha, a strip of the park, some 400 yards broad, extends in the same direction, to a beautiful lake, with a Pine-wood in the background, and above the tree-tops, of which glimpses of rugged hills and finely-wooded slopes are seen in the distance from the terrace-walks. Three-parts of this circumscribed space (farthest from the court) contain numerous beds of various shapes and sizes, of North American plants, of shrubby and trailing habit; rosaries, together with an interspersed of statuary, representing spring, summer, autumn, and winter, and various mythological deities. Opposite the south front of this court is a beautifully wooded and undulated park, which extends and broadens in an easterly and westerly direction, thereby opening out pretty peeps of distant woodland and mountain scenery. In this latter position flower-beds, no matter however informally disposed and shaped, would be obviously out of place. Hence the formation of the flower-garden at the north and east fronts of the court as indicated above.

There are some people, however, who condemn flower-gardens of every description on the score that they are artificial, unmindful of the fact that almost everything connected with our homesteads and our persons, if not with ourselves, is artificial. Flower-beds and flowers, place them where you will—whether within view of the windows, or in some secluded spot—are, like the crops we cultivate in the field and garden, to some extent, artificial; even in our woods, evidence of man's handicraft is not wanting. Nature in her wild state, with her gulfs, rugged rocks, deep ravines, and such like, is very beautiful, but sometimes it is capable of improvement at the hands of man. Great skill and a keen appreciation of natural scenery are necessary on his part in order to leave no trace of his work in the matter.

#### THE LAYING OUT OF A FLOWER GARDEN.

In making a flower garden, the first thing to be done, after a plan has been decided upon, is to level the ground in a line parallel with the house, and in accordance with the transverse level and width of walk immediately adjoining and communicating with the entrance to the house, excavating this, say, to the width of from 10 to 18 feet, according to length and height of house or mansion, and from 15 to 24 inches deep, according to the nature and depth of sub-stratum, so as to allow of a good thickness of rough material—stones, brickbats, and such-like being laid over the bottom of walk for drainage, and to which subject we shall revert presently. If the ground should run in an oblique direction from the house, it will admit of a sloping bank or terrace being made, extending from the edge of the walk down to a given point, whence the gradually and regularly sloping surface of the space whereon the beds are to be formed begin. In making a bank of the description indicated, it does not always follow that the width of the slope will be the same at both ends, or even at one end and in the middle, inasmuch as the ground may have a natural descent southward and westward, and it may be eastward as well, and which contrary gradients must be got over either by following the natural bent of the surface in the directions indicated on making additional banks and levels. However, the turf in the entire length and width of a bank between the top and bottom lines should be flat. The use of a straight-edge is necessary to this being done correctly. The upper line of the batter as well as the lower line on the level land at the bottom should be firmly and correctly made before the straight-edge is used; the latter being employed to detect inequalities in the face of the bank or batter. The ground-space set apart for the formation of beds, &c.,

and extending in an oblique direction from base of above-mentioned slope or bank, should be levelled accordingly.

If the terrace is of a good length—say, sixty yards or thereabouts—there should be three separate lots of stone steps descending therefrom to the walks connected therewith—two narrow ones, say 6 feet wide, one at each end, and one double that width in the middle, opposite the entrance to the house.

#### FORMATION OF WALKS.

The necessary number of main and connecting gravel walks should be pegged out as soon as the rough levelling—the scattering of the hillocks into the hollows—has been done. The excavations being used, if necessary, for levelling, making of terraces, rockeries, rooteries, and hardy ferneries in suitable places. It is a matter of importance that new walks should be made with due regard to the purpose for which they are to be used; and if for wheel traffic as well as for the use of pedestrians, as is generally the case in large gardens, a greater depth of soil than would be necessary in the case of walks for pedestrians only should be excavated, so as to find space for a good quantity of hard materials as a foundation, and for drainage. The first point to determine when making a walk, after the line of direction has been decided upon, is the width it should be made. Main walks should be, as in the case of terrace walks, from 10 to 18 feet in width, according to their length and the extent of the grounds; the others being from 5 to 7 feet (narrower in the case of Italian gardens) wide. This done, due regard should be paid to the level of the ground on either side of the walk (cross-wise), as well as the direction in which it is proposed to take the surface-water. A depth of from 12 to 18 inches, in a general way, is ample for walks of the above dimensions; but in cases where the top soil is shallow, and rests on chalk, gravel, or stone, all that is necessary is to remove the top soil, with which the ground on either side the walk may be rendered level, and depressions, if any, filled up. The bottoms of walks should be deeper at the sides, that is, the walk should be slightly convex, forming at the sides, as it were, channels to convey water away. If the substratum be chalk, the surface should be well pounded, allowing sufficient fall (longitudinally) to the points towards which it is decided to drain the walks, providing means at each outlet to convey thither any water that might lodge on the opposite side of the walk; that is, when it is convenient to have outlets connected with drains or "catchpits" on both sides of the walk.

In the case of walks resting on a bed of chalk, gravel, or stone, as mentioned above, a smaller quantity of hard material becomes necessary. A broad walk, having an excavated depth of 18 to 24 inches, should have at least 12 to 18 inches of rough, hard material—such as brickbats, clinkers, or stones—put into the bottom; over this a layer 3 inches thick of coarse gravel, followed by a like depth of fine red gravel, if obtainable. This should be raked level and smooth, and rolled as soon as dry enough—first with a light, and afterwards with a heavy roller, repeating the operation on four or five days in succession (weather permitting), or until a level, firm surface is obtained. Walks of from 9 to 12 inches deep should be afforded a layer of proportionate thickness of the several materials recommended for the work described above. Bold, graceful curves should be observed in making winding walks; where Box is used as an edging, the work requires to be performed with precision and neatness. *H. W. Ward.*

### NEW OR NOTEWORTHY PLANTS.

#### BOLBOPHYLLUM ORTHOGLOSSUM.\*

In general appearance and habit the plant may be compared with *Bolbophyllum mandibulare*, one of the giants of the genus. The bulbs, the leaves,

\* *Bolbophyllum orthoglossum*, Wendl. & Krzl. (Sarcopodium).—Caulibus secundariis s. bulbis approximatis ovalibus subcompressis ad 5 cm. longis ad 2 cm. latia monophyllis; folio

the flower-stalk, and even the flowers of our species resemble in a surprising degree those of *B. mandibulare*, reduced to nearly half the size of this species. But there the affinities end. The lip of this new species is, perhaps, unique in the genus. At first it is really three-lobed, the side-lobes being comparatively small, bent forward, toothed at the margin, and covered with little warts on the inside; the mid-lobe has a cushion-shaped thick base, and a tongue-shaped, fleshy, acute, straight apex. The column is at each side produced into a long bristly acute tooth. The flowers are comparatively showy, the sepals and petals being yellowish-green, with numerous brown stripes throughout their whole length.

This plant, as well as *B. multiflorum*, see p. 294, flowered at Herrenhausen, near Hanover, and was sent to me by Mr. Wendland. *F. Kränzl.*

#### RHODODENDRON × EOS.

THE illustration (fig. 44, p. 327) represents a complex hybrid *Rhododendron* raised in the Chelsea establishment of Messrs. James Veitch & Sons, by their foreman, Mr. Heal, and exhibited by them at the February meeting of the Royal Horticultural Society this year under the somewhat misleading name of *R. malayano-javanicum*, now changed to that given above. As seen by the synoptic view of the pedigree, four different species are concerned in the ancestry, two of which are, and two not, identical with those from which *Rhododendron* × *Nema* was derived (see *Gardeners' Chronicle*, February 1, p. 133), thence affording another case for observing the changes effected by successive crosses between species and hybrids. In the present instance all the forms concerned in the ancestry are in cultivation, and the modifications resulting from the various crossings can be easily traced. The most remarkable phenomenon in the series of crosses that produced *R. Eos* is the preponderating influence of the pollen-parent in the last cross, as shown by the form and colour of the flowers, and in a less degree by the foliage. This parent is *R. malayanum*, widely distributed over Malaya, and known to science since the early part of the century; it was originally introduced by Messrs. Veitch through their collector, Thomas Lobb, from Borneo; it was also sent to them by Curtis, from Sumatra, in 1833.

The present subject is the forerunner of a new race of warm greenhouse *Rhododendrons*, which has suggested the name (*Eos*, the dawn). It would be invidious to compare it with its brilliant predecessors of the javanico-jasminiflorum race, nevertheless gardeners will find it a very useful subject in the late winter and early spring months, on account of the bright warm colour of its flowers, which may be described as carmine toned with scarlet; their persistency, they last three to four weeks in perfection; and their profusion. The floral sprays will also be found useful for bouquets.

The central figure is *Rhododendron Eos*; the smallest one to the right, a small plant of the pollen parent, *R. malayanum*; that to the left, a small plant of the seed parent, *R. Monarch*, in bloom.

#### THE LARCHES, ALDERLEY EDGE.

ON a considerable eminence from the gorge through which the main line of the London & North-Western Railway has been made, is the residence of Wm. G. Groves, Esq., The Larches.

petiolato basi canaliculato oblongo obtuse acutato ad 20 cm. longo ad 5 cm. lato; scapo folium subequante, cataphyllis 3-arete vaginae vestito, paucifloro; floribus succedaneis inter majores generis, bracteis quam ovaria brevioribus; sepalis e basi ovata productis acumineatis, lateralibus basi carinatis; petalis semilongis ovatis acutis; labelli hypochilii tantum in mentum semilongia ovatis acutis; labelli hypochilii v. pede brevi, epichilio re vera trilobo lobulis lateralibus arotaris falcatis intus verrucosis marginis antico denticulatis, lobo intermedio proterico recto basi ipsa pulvinari spongioso medio sulcato, parte anteriore triangula carnosia acuta; gynostemio utriusque in dentem triangulum acutum producta. Sepala ad 4 cm. longa viridi lutea brunnea striata, petala semilongia eodem colore, labellum paulo longius purpureum. In Sarangani insula det. W. Micholitz, Freder. Sander Verulamensis collector indefessus.

Although only 12 miles from Manchester, the air is generally bracing and free from noxious vapours. Tree and shrub-life go on luxuriantly. What Conifers have been planted, unless those on the crest of the hill, are of admirable symmetry. The Atlantic Cedars which confront the line of demarcation are over 30 feet high, and not two of them alike, some with stiff horizontal branches, like the typical tree; others, again, verging towards the drooping habit of the Deodar. There is only one sole representative of the Cedar of Lebanon, but it is about the only one that refuses to move up into size and symmetry. The Austrian Pine is noble, but common-looking among its fellows, and the older it is, the less captivating. The P. Cembra does well in these rocky shelvings, and stands the breeze. On the contrary, as everyone knows, the Weymouth

and shrub life. In the low ground, Rhododendrons of the finest hybrids luxuriate. On the slopes and over the boulders, the Irish Ivy and the Gaultheria Shallon are in close embrace, and each berries beautifully in its season. The Cotoneaster is represented in rather a unique way—a hedge of *C. Simonsi*, 4 feet by 3 feet, forms the arc of a large circle confronting the house, and it is closely shaven with shears, and beautiful it looks as a hedge, adorned, too, with its multitudinous crimson berries. Spacious as it is in bulk, it moves back and forward to the touch. The *C. microphylla* is planted against the house, and, being on a southern exposure, its branches grow outwards, and drape beautifully, and its crimson berries make it particularly interesting in the dead of winter. The Irish Ivy is also used on the gables effectively.

Palms, tree and other Ferns, the flowers and flowering plants being taken indoors for room decoration. Another conservatory on the top of the hill is kept gay for knitting generally.

There are a large vinery and a Peach-house with curvilinear front, and the sashes running up to the wall, giving a splendid length of Vine and Peach, and each house turns out fine crops. In the former, Muscat of Alexandria and Black Hamburg are the chief occupants. In the latter, Royal George Peach and Elruge Nectarine are the only sorts grown. The wood is strong, the buds are prominent, and the branches all thinned out, so as to give proper light, and encourage size and quality of fruit.

The greenhouses are filled with a variety of plants, especially for the production of cut flowers. The Roses in one of them were in extra "fettle," planted

FIG. 44.—RHODODENDRON X EOS. (SEE P. 326.)

(A, R. MONARCH; B, R. EOS; C, R. MALAYANUM.)

PEDIOREL—

stops short in the wind line; below it is quite at home. The Chili Pine (*Araucaria imbricata*) is doing magnificently. What trees there are of it are quite 48 feet high, and in outline like a cone from bottom to top, without a single flaw. The Japanese Retinosporas are models in their way, the splendid golden sheen of *R. plumosa aurea*, and the dusky brown of *R. quarrosa* especially elegant because of its drooping habit, contrast well with other Conifers of the gloomy green order, and although they are formal, excessively so, one can do with them, because they are naturally so, not like those clipped and tortured Hollies which some people delight in cutting to imitate extinguishers. This undulating ground presents an admirable surface for a variety of trees

The principal trees of great bulk are Beeches. The Birch does splendidly. There is one capital example of a rickety tree, with its silver bark clad with black wens. This has been the cause of keeping down its stature; but what it has lost in height, it has gained in spread of branches, forming when covered with leaves a grand sunshade. There is one representative of the Cork Birch; this tree will be over 40 feet in height, and of typical symmetry. For about a third of its height the stem is completely black with the usual cork-looking corrugations. The remaining portion of the stem is white, showing here and there a black scar which doubtless will in time form into a cork-looking covering.

The conservatory attached to the house is filled with

out, but kept within bounds, and not allowed to clamber along the roof. The chief one, and the great favourite here, is Catherine Mermet, also the climbing Niphotos, and then Madame de Watteville. The plants are in perpetual greenery, and the flowers in holiday-time in the dead of winter are up to the mark. One of the most useful things in the Azalea way is the white-flowering, sweet-scented deciduous *A. Daviei*. Amongst the more useful things is a pretty glaucous, ovate-leaved *Spiraea*, named *confusa*. It is a dwarf species, with multitudinous short racemes of pretty whitish flowers. The *Lachenalia tricolor*, with its red and yellow tubular blossoms, is a very effective plant at this season. In the warmer house,

Anthurium, with their brilliant scarlet spathe, are prominent. A very good winter-flowering Begonia, named Gloire de Sceaux, is useful for cutting; its fine peltate, roundly ovate leaves, of broody hue, make a capital setting for the rosy-pink flower umbels.

Orchids, however, are the feature in this well-managed, admirably-kept establishment. There is a very considerable variety of the species grown here, and the houses generally are well adapted for their cultivation. This is sometimes lost sight of, particularly by beginners, who in consequence do not give their gardeners a chance, and hence, even under the very best management some of the plants deteriorate in value. The Dendrobium-house had been at one time a vinery, and this kind of structure is about the best available for the genus. It permits the majority to be grown in pots or baskets suspended from the wires running parallel and close to the glass. And thus the ordinary sorts for cutting liberally from can be placed as they are here on the sparred wooden stage, 3 feet from the ground. The plants seem all to be doing well. There are many varieties of *D. nobile*, which in its finer varieties, still take first rank. There is a good many of *D. nobile Hardyannum*, which is a much better variety than I at one time supposed. There are many, too numerous to detail, of that section—all, however, grown as they ought clearly to be, in limited pot-room, throwing fine pseudo-bulbs, and showing well up for flower. The one that struck me most, which I know to be a miffy grower, was *D. Lowei*. It is remarkable how well this does even here, although it is better in warmer quarters, along with the *D. Phalænopsis* section. It is one of the most beautiful, with its yellowish-lined labellum. *D. Johnsoni* is a clear gain among the white ones, because of its abnormal enlarged lip. *Peristeria elata* does well in this climate, the pseudo-bulbs being very large and likely further to improve. A very fine form of *D. fimbriatum oculatum* was in flower, with the deep orange flower, and the intense crimson blotch on the base of the labellum. Some good-looking *D. Findlayanum*, with gouty-looking nodes of great prominence, associated well with the beautiful sweet-scented heterocarpum, which has proved itself so useful to the cross-breeder.

Two very useful span-roofed houses, each 25 feet by 10 feet, are filled with an interesting assortment of plants. *Cypripedium insigne* and its varieties are in evidence, and so is a batch of the various *Cælogyne cristata*—all used for cutting. The Trentham variety is useful for coming in so late, and it is so easily known from its rhizomes. The fine hirute variety of *Dendrobium Jamesianum* was flowering and doing well. There is a specially fine form of *Epidendrum Wallisi*, with more than usually prominent yellow segments, and large expanded irregularly-raised white lip, with pretty pinkish lines. *Vanda cœrulea* is grown here in quantity, and is as varied in its habit as it is in breadth, length, and position of the amplexicaul leaves. The various forms of *Lælia anceps*, from white up to coloured forms, have been and were still in flower. It forms a fine contrasting plant to the bright vermilion of *Lælia harpophylla*, of which there were numerous examples in flower. A good number of *Cattleya labiata* were growing freely, and there were quantities of *C. citrina* with fine fat ovate bulbs, with their paper-white exterior coating, so unlike those of allied species—unusually fine.

In the adjoining compartment was the collection of *Cypripeds*, the more important in flower being *C. × Argus*, so prominently spotted, and the dorsal sepal beautifully lined, quite model, too, in point of form. The *C. × Atsworthii* is larger, and better in every way than *C. × Sedenii*, and the pretty *C. Schlimii*, which is still in front rank, and many others. *Miltonia Roezlii* does well here, the pretty white one with yellow crest being in flower. Here, also, we have *Dendrobium Lowii* in grand culture, one example particularly, others promising well. *Vanda Sanderiana* and *V. Amesiana*, as well as *Aragræum sesquipedale* were moving well towards the glass roof. *Cattleya Bowringiana* is a strong

subject, and one that will not be easily beaten in collections. There is a remarkably fine piece of *Cattleya Trianae*: *Reine des Belges*, some very good *C. Percivalliana*, with its lip brilliant in the blotch, and the segments highly coloured. *C. præatans*, when in fine variety, as here, and in good health, is very captivating, suspended in a pot from the roof. *Brassavola Digbyana* and *glauca*, particularly the latter, was in fine flower; it is a beautiful species, and one with a deep rose eye at the base of the labellum was very beautiful, the more so because it had a widely-expanded lip, and was whiter than the normal flower.

In a detached lean-to house were grown, among other things, some *Phalænopsis*. When this species is well done, it is beautiful in its many varieties, and it is a pity it is not more generally grown. Here were some extra-fine forms of *P. amabilis*, one extraordinary fine form of *P. × leucorrhoda*, with a branched panicle of over twenty flowers—and such flowers for size as beat the ordinary *Moth Orchids*, and the flushing so very delicate. *P. Schilleriana* was also in flower in several varieties, one with deep roseate segments being very striking. *P. Sturtiana* is a welcome addition from the very pretty spotting on a lip; these were grown on teak cylinders, and seemed to be quite at home. *Dendrobium Phalænopsis* was growing suspended in pots in this climate, and they appeared to be all holding their ground—but will they continue to do so?

In a span-roofed sunk house, divided in two, were the cooler section of *Orchids*. *Lycaste Skinneri* and *alba* were in fine health and in flower. A rather taking *Lycaste* in the way of lanipes in the flower was striking. It is named *trifoliata*, because of the three leaves on the top of the pseudo-bulb. The flower is whitish, but the petals sweep round in outline to form a curve, and almost converge together at the apices. The lip is nearly pure white, with an irregular short frilling round about it.

*Maadevallia tovarensis* had quite a hundred flowers on a single plant, and for pure and paper-like texture it has no equal. It has certainly deteriorated in value these last dozen years, but not in beauty. There are many examples of the *Harr yana* and others common to collections; *Odontoglossum Uro-Skinneri* is in flower and mixes well with a mass of other colours. *O. pulchellum majus* is sweet and nœfol, and *O. citrosum* in several forms were showing well for flower. *O. grande* and *citrosum* evidently liked this climate. *O. coronarium* is simply growing superb on its moss-covered raft; the best pseudo-bulb will be more than half larger than the previous one, and when it flowers it must produce a wonderful hyscynth-looking spike. (See *Gardeners' Chronicle*, vol. xviii, 1895, p. 489, fig. 84, for extended descriptive notice.)

In the cooler division, there are many excellent *Odontoglossum crispum*, a very finely-grown *O. Andersonianum*, some good *O. Pescatorei*, *baphicanthum*, &c. We must not omit to notice the *Odontoglossum padinum*, a yellow and gold, with a good lip adorned slightly with sienna blotches. The collection and varieties of *O. Rosii* are very noteworthy, the flowers being large and generally first-rate; the plants are in first-rate health, bearing hundreds of flowers. The plants are placed on a shelf quite close to the glass. We must specially notice that sweet-scented *Oncidium cheiroporum*; it is much valued here, its short panicles of yellow flowers being very prominent. The whole place is under the superintendence of Mr. E. Robertshaw, an old Trentham and Chatsworth man, under Stevens and Speed, and he certainly does every credit to the distinguished establishments in which he was trained. *J. A.*

## ORCHIDS AT KEW.\*

(Continued from p. 198.)

The first great step in the improvement of *Orchid* culture was "the heating of glasshouses by means of hot-water pipes, which were first used for this

purpose on a small scale by Mr. Anthony Bacon, at Aberaman, in Glamorganshire, and afterwards by the same gentleman at Elcot, near Newbury. The inventor of the process is said to have been a Mr. Atkinson" (Veitch, *l. c.*, pp. 122, 123).

The same writer sums up in the following words the chief features of modern practice:—"Larger and more airy structures, with separate compartments for different climates (for large collections even separate houses); a lower average temperature; the admission of more light and air; and a better system of heating, shading, and ventilation" (*l. c.*, p. 124).

It must, however, be admitted that a considerable number of species still refuse to submit to horticultural conditions. *Cattleya citrina*, many species of *Oncidium*, and the beautiful Cingalese *Dendrobium MacCarthii* are examples familiar to every *Orchid* grower.

One species, however, that is usually found to be intractable, *Diacrium bicornutum*, has always been grown at Kew with little difficulty. On the other hand, it seems impossible to grow *Disa grandiflora* there with the success that attends its cultivation at Edinburgh and Chatsworth. Perhaps the most baffling genus of all is *Anæcœchilus*, the species of which, under apparently identical conditions, will sometimes flourish with facility, while at other times, for no discoverable reason, they refuse to grow at all.

In 1845 the span-roofed house, which now forms the east wing of the Tropical Fern House (No. II.) was erected on the site of an old stove (No. 3 of Dr. Lindley's Report). Sir William Hooker describes it (in 1846) as "occupied with a rich and inestimable collection of Orchideous plants (of which a great proportion was presented by Her Most Gracious Majesty)." This gift was recorded by him in 1844 as "the entire and valuable collection of Orchideous plants formed at Woburn Abbey, which on being offered to her by the present Duke of Bedford, Her Majesty was graciously pleased to accept and to send to the Royal Gardens at Kew." Continuing Sir William Hooker's account of the house:—"The centre is filled with a handsome stage slating, so large as to admit of a raised walk through the centre, thus enabling the visitor to look down upon each side of the house; while, over his head, and from the rafters on either hand, are suspended wire-baskets, filled with beautiful tropical epiphytes. . . . As the house in question opens on to another and cooler stove (No. 2, now the west wing of No. II.), we are enabled to remove the splendid epiphytes, when in blossom, to a less heated atmosphere, and thus preserve them in beauty for a much longer time. The Orchideous-house is assuredly one of the most interesting among the novel features of the establishment."

In 1847 Sir William Hooker further recorded:—"The Orchideous-house . . . has proved admirable for its structure, mode of heating, and the general arrangement; the plants, which have been increased (1846) by the noble bequest of the Rev. J. Clowes, of Broughton Hall, near Manchester, who willed his splendid collection of Orchideæ to the Royal Botanic Garden." It is somewhat remarkable that this is the only bequest which the *Orchid* collection at Kew has ever received.

Many of the *Orchids*, however, did not thrive in the house provided for them, which proved too large for the smaller species. These were therefore removed to the present *Orchid-pits* (now No. XVI.) about 1851. From about 1855-1862 part of the collection was maintained in some old fruit-houses in the present herbageous ground, which had been remodelled and heated by hot water. In 1863 the whole of the *Orchids* had been removed to these houses, and they remained in them till the erection, in 1869, of those in which they are now exhibited to the public. The old houses were pulled down.

The *Orchid-pits* (XVI. a & b) are amongst the oldest structures in the establishment. They are the "double propagating pits" of Dr. Lindley's Report (1840). The north end is formed by the only remaining portion of the wall of Methold's garden (it having originally belonged to Methold House, the

\* We take these interesting statements from the *Hand-list of Orchids Cultivated at Kew*, just published.

FIG. 4.—CYPRIPEDIUM SANDSONIANUM.

Director's present official residence), which was added to the Botanic Garden in 1846. These pits were heated with hot water in 1842 and rebuilt on more modern principles in 1884. The small Maedevallia-house (XVI. c) to the north was re-constructed in 1893.

According to John Smith (*Records*, p. 235), "in 1848 the number of species cultivated at Kew amounted to 755, and in 1850 to 830." By the same authority it is stated in 1864 to have been 638. In 1868, according to the *Botanical Magazine* (t. 5692), "Kew only possessed about 400 epiphytic Orchids;" in this enumeration there is probably some error, as in 1872 the number of species and varieties in cultivation was 851, belonging to 138 genera. Since that time the collection has steadily increased.

The *Kew Bulletin* for 1891 (pp. 52-75) contains a list of the Orchids, 766 in number, which flowered in 1890.

One striking evidence of the mastery which horticulture has gradually acquired over this difficult branch of cultivation is the successful production and rearing from seeds of hybrids.

This commenced with the work of Dominy in the nurseries of Messrs. J. Veitch & Sons, at Exeter, in 1853, and it has been continued ever since with increasing interest and success. It has not been without its scientific value in indicating that many genera, reputed to be distinct, are more closely related than had been supposed. The great range of species which Kew has at its command suggests attempts of this kind. And in the genus *Diaea* it has produced crosses which are easy of cultivation, and will probably become popular as ornamental plants.

#### CYPRIPEDIUM SANDSONIANUM.

STANDING alone in the distinct characters of its peculiarly-twisted and undulated petals, and some other points which make it of special botanical interest, this fine species is remarkable as being the most advanced member of the section of *Cypripedium* to which it belongs, and which approach nearest to the shiny, green-leaved *Selenipediums* of South America. It is a particularly striking species among the warm-house *Cypripediums* when seen in flower, and many cultivators are looking forward to the time when really good importations of the plant will enable purchasers to gratify their desires, for although introduced from the Malay Archipelago by Messrs. F. Sander & Co. through their collector Förstermann in 1886, it is still comparatively rare.

In appearance the plant resembles *C. Rothschildianum*, and in the inflorescence the purple hairy scape and the yellowish sepals striped with purplish-chocolate, have a resemblance to that species, but in the peculiar wavy petals which have been known to attain a length of 3 feet, which are pale yellow spotted with dark purple, it is distinct from any known species. The lip is purple-brown on the face and pale yellow beneath. The staminate is yellow with purple lines at the sides. If placed in a warm, moist house of an even temperature, *C. Sandsonianum* is not difficult to grow, and the probability is, that owing to its being often placed in the general collection of *Cypripeds* from cooler habitats, accounts for the scarcity of really fine specimens of it. Our illustration (fig. 45) was taken from a plant recently shown at the Royal Horticultural Society by Messrs. Hugh Low & Co.

#### FORESTRY.

##### PLANTING GAME COVER.

SOME correspondence has recently taken place in the columns of the *Gardeners' Chronicle* over the most suitable trees and shrubs for resisting the attacks of rabbits, and from the lists given by correspondents it would appear that very few plants are entirely proof against these rodents. It is only natural, however, that the rabbit should endeavour to appease his hunger with the most palatable food

he can find, and it is all one to him whether the food that he eats costs his patrons a small fortune or merely the land upon which it grows. The rabbit's natural food is grass; under ordinary circumstances he has no great difficulty in getting it. When a heavy fall of snow covers the ground and all surface-vegetation for the space of a month or six weeks, the rabbit shows us what a very efficient set of barking instruments he possesses. A novice in tree-planting who chanced to see the destruction wrought by rabbits during a hard winter might innocently inquire, "Why plant trees where there are rabbits?"

If we must plant on rabbit-warrens, it is better to put in as few as possible to the acre, and to afford each tree a wire-netting guard; but, as a rule, all rabbits should be kept out of young plantations and places where there are shrubs which they bark in hard weather, and this is readily done by fences of rabbit-proof netting, the lower edge of which is bent at a right angle and buried underground, the keeper doing the rest. Game coverts should not have the trees so numerous that grass and underwood cannot exist; and where pheasants are preserved, the Douglas Fir makes a good tree for roosting in, as it has a dense habit, and the birds when roosting are hidden from sight. A few clumps of Douglas mixed with other clumps or single trees of other species that may be preferred, and the space between left to itself, will soon form an ideal game covert. This method of getting up a covert is cheap and effective, and the cost of management is entirely confined to keeping the fences and rides in order. A modified form of it might even be adopted where timber is wanted, by carefully fencing in with netting patches of an acre or so, and planting and treating them on strictly silvicultural lines. Such a cover would consist of little islands of timber in a wilderness of woodland reserved for game, and would be much better than going to the trouble and expense of establishing a large plantation, and spoiling it later on by over-thinning for the sake of getting undergrowth. *A. C. Forbes.*

## FOREIGN CORRESPONDENCE.

### FERRIÈRES-EN-BRIE.

In the well-known gardens of Baron Alphonse de Rothschild was to be seen recently a magnificent display of Phalanopsis. Notably in flower were *P. amabilis*, *P. Schilleriana*, *P. Stuartiana*, *P. Sanderiana*, *P. grandiflora*, *P. rosea*, and *P. Emeralda*. The house, a span-roofed one, is filled with the flowers of these species from top to bottom. Many of that handsome variety, *P. Schilleriana*, were bearing more than thirty flowers on one spike. The plants, in pots, are suspended from the roof, and all, without exception, appear to be in perfect condition, showing that their culture is thoroughly well understood by M. Bergman, the head gardener. *A. C. C.*

## THE WEEK'S WORK.

### FRUITS UNDER GLASS.

*By W. Pope, Gardener, Highclere Castle, Newbury.*

**LATE VINERIES.**—Vines from which fruit is expected for dessert during the winter and early spring, consisting of Black Alicante, Muscat of Alexandria, Lady Downe's Seedling, &c., should now be permitted to start into growth, so that the Grapes will be perfectly ripe early in the month of September. Gros Colmar especially is one of those varieties which, if not ripened early in the autumn, when sun-heat is still strong, is almost flavourless. To have this variety really at its best, the Vines should be started with the Muscats early in the month of February. The exceptions to starting forthwith are, where the Vines have been recently pruned they should be kept cool for a week or two, taking the precaution to dress the wounds with styptic, to prevent bleeding at this late season. Late Hamburgs need not be started till the beginning of April. The inside borders of vinerias now closed should have a good watering, the water to have a tem-

perature of 85°. This will tend to stimulate the roots into vigorous activity, and compensate for the diuse of fermenting materials, which need not be used at this part of the season. The Vines should be well syringed, and the atmosphere kept moist till the Canes have pushed generally into growth, the treatment afterwards being that advised in earlier Calendars. Vines for fruiting early in pots next season which were cut back, will now need to be shaken out of the soil and repotted. Use for them 12-inch clean or new pots, turfy loam in a rough state, to which add a 6-inch potful of half-inch bones per plant. See that the drainage is good and sufficient. Bottom-heat will not be necessary after potting, but the plants should be kept close and moderately moist till established; train the canes as near the glass as possible as growth advances, to ensure firm, short-jointed canes. Vine-eyes struck in the month of January or early in the following month, if well-rooted, should be shifted into 6-inch pots, the soil used for potting the cutbacks being suitable for these. Stand them over the hot-water pipes if possible, and gently syringe amongst them every day, but not so as to break the tender leaves; keep the laterals pinched at the first leaf. These may also be grown on for furnishing fruiting canes the first year, and are by some gardeners preferred to "cutbacks."

**EARLIEST-FORCED FIGS IN POTS.**—When the first swelling of the fruit is completed, checks of all kinds should be guarded against at this most critical period. Lack of root-moisture or excessive heat is a frequent cause of the fruits dropping at the commencement of the second swelling. A night temperature of 60° to 65° should not be exceeded, with a fall of 5° in cold weather. Admit air carefully, and avoid cold draughts. Close the house early with sunshine, and plenty of moisture at 75°; syringe the plants twice a day well, taking especial care to wet the underside of the leaves, where red-spider most do congregate.

**PLANTED-OUT FIGS.**—These will require close attention in the matter of thinning and stopping the shoots at the fifth or sixth leaf, so as to throw a second crop of fruit. Thin the clusters of shoots to one on each, training and regulating all extension and terminal shoots as may be required, and keep the house moist. It is prudent to take the points off shoots in preference to allowing them to extend too much, and form long spurs; and pinch back with the finger and thumb, as it results in less bleeding than when cuts are made. Thin the fruits as they advance in growth.

### THE FLOWER GARDEN.

*By HEDLEY WARREN, Gardener, Aston Clinton, Trinj.*

**PRUNING ROSES.**—The proper time for effecting this important operation will soon arrive, and as I remarked in a previous Calendar, the Roses have already started into growth, owing to the mild weather. Roses planted during the present season will take no harm if pruned a week or two earlier than established plants, and they may also be pruned more severely, as, by so doing, stronger growth from the base of the plants is effected, and, as a consequence, a better foundation for the future head. Some gardeners prune to within an inch or two of the level of the ground in the case of newly-planted young Roses. Old wood in dwarf, standard, or climbing Roses, should be partially removed every year at this season, so as to throw all the vigour of the plants into the younger shoots. As a good deal depends in Rose-pruning upon the character of the season and the situation of the plants, how to prune must be left to the discernment of the pruner; still, the following hints are always in place:—All weak wood should be cut hard back, the remainder being reduced according to its strength, and the health and vigour of the plants. A knife is much to be preferred to *secateurs*, which do not make clean cuts, but leave snags, which form hiding-places for a variety of insects. In old established beds of Roses the practice of pegging-down a number of the strongest growths is followed by some, and it has much to recommend it, as by that means a greater number of blooms is obtained, although this is usually at the expense of quality, and unless the work is very neatly done, the beds present an untidy appearance. A few good varieties making long strong shoots suitable for being pegged down, are the following:—Noisettes: Aimée Vibert, Bonquet d'Or, Jaune Desprez, Fellenberg, Jeanne d'Arc, La Riche, and Triomphe de Ducher. Tea-scented: Gloire de Dijon, Cheshunt Hybrid, Homer, Madame Berard, Madame Levet, Reine Maria Pia, and Waltham Climber No. 1. Fine massing Roses

for summer are—Madame Hardy and Madame Zostmann amongst Damask Roses; Paul Ricant, as a hybrid Bourbon; and the Austrian Briars. For autumn bloom the following H.P.'s are excellent:—Anna Alexieff, Baroness Rothschild, Captain Christy, Chas. Dickens, Crimson Bedder, Dr. Andry, Duchess of Bedford, John Hopper, Jules Margottin, La France, Madame Ducher, Magna Charta, Pride of Waltham, Victor Verdier, and White Baroness. Bourbon: Mrs. Boanquet, Queen of Bedders, Sir Joseph Paxton, and Souvenir de la Malmaison.

### THE ORCHID HOUSES.

*By W. H. WHITE, Burford, Dorset.*

**ODONTOGLOSSUM CITROSUM.**—A beautiful, much-admired species, from Mexico, whence large numbers are imported, and which is of easy culture. The flowers are of much use in bouquets, &c., when cut from the plants, and the plants themselves can also be put to decorative purposes for brief periods of time in apartments. Established plants will now be starting to grow, and although the large pseudo-bulbs may be shrivelled, owing to a long rest, no water should be afforded before the growths have made considerable progress, and the flower-spikes push up through the centre of the growths. The flower-spikes are viable at a very early stage in a small white shoot, and as soon as this is noticed the plant should be immersed in a pailful of water, the water being allowed to just cover the top of the compost, and the plant to remain therein for several minutes; afterwards placing the plant in a warm, moist, growing atmosphere. The flower-spikes must, from the first, be protected from woodlice, slugs, &c., by wrapping a small piece of cotton-wool around them. The plants may be suspended close up to the roof, where the long pendulous racemes of blossoms are effectively seen. The best time for re-potting the plants is just after the flower-spikes are cut from the plant, or the flowers faded.

**DENORBIUMS.**—Plants of *D. cretaceum*, *D. crepidatum*, *D. primulinum*, *D. Pierardi*, *D. litniflorum*, *D. cucullatum*, and any others whose flower-buds are prominent, will require more warmth and a more generous treatment.

**CATLEYA-HOUSE.**—Plants of *Cattleya Lawrenceana*, if the flower-spikes are visible in the sheaths, should be afforded more water at the root, and a more elevated part of the stage at the warmest part of the house. Plants of *Cattleya Rex*, *C. Dowiana*, and its variety *anra*, now about to start into growth, should be similarly treated. *Luddemannia Lehmanni* and *L. triloba* are species possessing much floral beauty, as well as being of interest to admirers of what are called "botanical species," and they should, as soon as growth recommences, be applied with a fresh compost of peat and sphagnum-moss. On account of their peduncular inflorescence, the plants must be planted in shallow baskets, with no crocks at the bottom to hinder the egress of the flower-spikes. After root disturbance, water should be afforded with care, the old pseudo-bulbs being very liable to decay from an excess of moisture. These freshly-potted plants should not be immersed in water, but the compost and the sides of the basket lightly sprinkled with a watering-can having a fine rose. The quantity of water may be gradually increased as the roots become more active. Hang the plants when re-established in a light part of the house, and sponge occasionally with clean rain-water to remove red-spider.

**PLEIONES.**—The varieties *P. concolor*, *P. lagenaria*, *P. maculata*, *P. praeox*, *P. Wallichiana*, and *P. Reichenbachiana*, will now be making roots and growth, and should occupy that part of the *Cattleya* or intermediate-house where air is or can be freely admitted, and where they are but thinly shaded, and then only when sunshine is very bright. At the present time water may be afforded without stint, and occasionally some weak liquid-manure. In fine weather the underside of the foliage should be well syringed once or twice a day. Those varieties *P. Hookeriana* and *P. humilis* which require cooler treatment, and have now gone out of flower, should be repotted when growth begins, using a compost consisting of peat, loam, and chopped sphagnum-moss in equal proportions, with a moderate quantity of coarse silver-sand, mixing these together. The plants may be hung close to a roof-ventilator in the *Odontoglossum*-house; and till the roots have ramified the compost, water must be but sparingly afforded.

**ODONTOGLOSSUMS.**—The season has arrived when more root-space may be afforded to those plants

that need it, and for repotting or top-dressing those which have ceased flowering. Only those *Olonoglossums* should be disturbed whose condition renders repotting, &c., quite necessary, and all others should be left alone till the autumn.

### THE KITCHEN GARDEN.

By C. HERRIN, *Gardener, Drogheda, Maidenhead.*

**ASPARAGUS BEDS** should now receive attention. Where these are flat, and a good dressing of half-rotted manure was placed over the beds in the early winter, any rough or undecayed portions should now be lightly taken off with a wooden rake, and the surface slightly pointed over with a fork, taking care not to injure any of the crowns. Break the soil up finely as the work proceeds, and leave a fine and even surface. The practice of laying a heavy dressing of rotted manure on the beds now, and covering this with 2 or 3 inches of soil is useless, and will rather hinder than promote an early growth of Asparagus heads. The surface should be made light and open, to admit as much sun-heat as possible. If the plantations did not receive a winter dressing of manure, a little salt and soot may, with advantage, be sprinkled over them before forking the surface. In regard to raised beds, the rougher portions of the winter-dressing should be raked into the alleys. The surface of the beds should then be pointed with the fork, and the beds lined out afresh. When forking-up the alleys, a small portion of the finest soil may be spread over the beds on either side as the digging proceeds. Should the soil be in any degree lumpy, allow it to become pulverised by rain and wind, and afterwards level over finely with a rake. Where it is intended to make new plantations during the month of April, the ground should be thoroughly trenched, at least 2 feet in depth, and a heavy dressing of manure be well incorporated with the soil to this depth. If the natural soil is of a heavy nature, the addition of road-scrappings and parings, and any sandy or burnt refuse, may be made with advantage as the trenching proceeds. Asparagus-seeds may now be sown thinly in shallow drills, 1 foot apart, on a warm border. Where roots are required every winter for forcing purposes, a supply of plants should be raised from seeds annually, and the seedlings be transplanted the following year into the prepared quarters to be grown on for forcing. Three years at least should be allowed from the time of sowing to lifting for this purpose.

**PEAS.**—Continue to make additional sowings of Peas in proportion to requirements. If ground can be spared, it is better to grow a greater quantity of such an important vegetable than is required, rather than err in the opposite direction. In sowing the varieties of Peas, it is not always safe to sow as soon as the previous crop is just above-ground. For instance, the two well-known kinds, Duke of Albany and Autocrat, if sown at the same time will form a good succession, the latter taking at least ten days longer than the former, before the Peas are ready for picking. If Autocrat was sown when those of the Duke of Albany were just above-ground therefore, a deficient supply must result. Any of the Marrowfat Peas may be sown now. Where plenty of room can be given, I prefer the tall-growing kinds; the dwarfier ones being admirably adapted for small gardens or where there is a difficulty in obtaining the necessary sticks. Duke of Albany, Criterion, Telephone, and Telegraph represent four excellent tall-growing varieties, suitable for present sowing; Sutton's Favourite Marrowfat, Dwarf Defence, Stratagem, and Dr. Maclean, a similar number of varieties growing from 2 to 3 feet in height.

**LEEKs.**—A small sowing of Leeks should be made to supplement those sown in boxes; if not grown for exhibition, a sowing made now will satisfy all ordinary requirements. As these are best transplanted into shallow trenches when large enough, one row, if 15 or 20 yards in length, sown alongside the Onion-quarter, and treated similarly now to that crop, should furnish abundance of plants for transplanting to permanent quarters later on.

**FORCING-PITS.**—Another sowing of French Beans should be made either in a bed of soil (which is preferable when circumstances permit), or in 8-inch pots. The last sowing is now coming into flower, and heavy syringings will not be advisable for a time. If cold pits or frames are available for the production of the late supplies of French Beans under glass, large 60-sized pots should now be filled three-parts full of soil, and five Beans be sown in each. Place them in a temperature of

about 50°, and they will furnish an advance batch ready for planting out in pits early in April. Another batch of Asparagus roots should now be brought into this structure. The crowns at this season start readily, and a temperature of 55° to 60° as a maximum will suffice.

**GENERAL WORK.**—During rainy and stormy weather, when outside work is impossible, Peasticks may be prepared, sorted into sizes, ready for use when required. If the necessary number of Spacale has not already been cut for forming the new plantation, prepare these at once, and afterwards place them in boxes of sandy soil ready for planting shortly. Broccoli should be gone over daily, and those hearting-in should be covered with leaves as a protection from slight frosts.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Rolleston Hall, Burton-on-Trent.*

**CLEANSING AND PRUNING TREES.**—The last two months having been very favourable for work among fruit-trees, very little winter-work should now remain to be done. If, however, any trees have yet to be planted, let such work receive attention at once, being very careful that the roots are not exposed to drying winds for a minute longer than is absolutely necessary. Prune, and mulch, or stake any trees that still require to be done. It is beneficial to all spring-planted trees to give them a good syringing with water early in the afternoon on dry days, continuing the practice until the leaves expand. Morello Cherries and other trees planted against north walls are generally the last to receive attention. The pruning and re-fixing to the walls of these, also, should be quickly finished, as the buds are swelling up very fast; and if the work be left any longer, it will necessitate very careful handling to prevent the loss of a number of buds during such process. In places where the rainfall has been light during the last two months, the soils in borders against south walls may have become drier than is usual at this time of the year, and it will be well to examine them. Should they be found at all dry, give them a good soaking with weak manure-water, sufficient for the trees during the blooming season.

**GRAFTING.**—If it is intended to re-graft any trees this season, take off sufficient scions, and heel them in behind a north wall until required, also head back the branches of the trees it is intended to graft, as advised on p. 15. In selecting scions for stocks, care should be taken to choose only strong-growing scions for robust-growing stocks, and the medium-growing scions for medium-growing stocks. It is of great importance also to select only those varieties that appear to thrive in the locality, bearing in mind at the same time the varieties that are required to constitute a collection which will give a continuous supply of fruit for the kitchen and for dessert during the longest period that they can be had. A few good varieties of Apples of excellence, and likely to succeed in most districts, are Duchess of Oldenberg, Lord Grosvenor, Lord Suffield, Pott's Seedling, Stirling Castle, Ecklinville Seedling, Warner's King, Beauty of Kent, Bismarck, Lord Derby, Small's Admirable, Rymer, Mère de Ménage, Lane's Prince Albert, and Bramley's Seedling, for kitchen use; Irish Peach, Lady Sadsley, Worcester Pearmain, American Mother, Cox's Orange Pippin, King of the Pippins, Claygate Pearmain, Marzil, Rosemary Russet, Adam's Pearmain, Cockle's Pippin, Allan's Everlasting, and Scarlet Nonpareil for dessert.

### PLANTS UNDER GLASS.

By JNO. MCINTYRE, *Gardener, Woodside, Durlington.*

#### THE TEMPERATURE OF THE VARIOUS HOUSES.

—The weather keeping genial and mild, the warmth of the house where *Codiums* are grown chiefly may be increased to 70° by night and 75° by day, or 80° with sun-heat. In the stove, where the plants are of many different genera and species, a night temperature of 65° and by day of 75° will suffice. The warm fernery may have 55° at night, and by day 60°. The ventilation of these various houses requires careful attention, air being afforded for a few hours daily when outside conditions are favourable, the new pushing growths of all stove plants being greatly strengthened by so doing.

**DRACENAS.**—Specimen plants which have been much in use in house decoration may have lost many of their lower leaves, and should be decapitated, a practice I always adopt. The stem is stripped of the

leaves, notched or rung just below the first imperfect healthy pair of leaves, and sphagnum-moss is fastened round it at that spot, and kept moist. At this season roots are readily put forth, which, when fairly developed, suffice to maintain the head, and it may be severed from the stem and potted in 4 or 5 inch flower-pots, placed in the propagating-case, and kept close for a few days. In potting *Dracenas*, peat, loam and silver-sand are required. The bare stems may be cut up into pieces of about 1 inch, and inserted in pans filled with silver-sand, placed in strong bottom heat—the hot-water pipes in the stove answer well for this purpose. If old plants are shaken out of the pots, it will usually be found that suckers have formed on the roots, which, if potted and plunged in bottom-heat will make shapely table-plants.

**GLOXINIAs AND POINSETTIAs.**—Seeds of the first-named may now be sown for raising plants to flower late. The aged plants of *Poinsettia* may be put into heat and afforded root and top-moisture, in order that a good break may be obtained. These young shoots, or at least the best of them, may be taken and struck for increase of stock. I do not advise plants to be kept longer than two years at the utmost, as the cuttings make more shapely plants and have finer bracts. These soft cuttings should be severed with a heel of older wood, and struck singly in thumbes, plunging these in the propagating-case to root.

**FUCHSIAs.**—If largely grown, the general stock of plants should be placed in gentle heat. Some growers take *Fuchsias* while still dormant straight to the potting-shed, shake them out of the soil, prune hard back, and re-plant before placing them in warmth; but while fairly good results may follow this kind of treatment, better ones attend the following method:—In most gardens the *Fuchsias* are dried off in the autumn, and housed in a dry place, or beneath the greenhouse stage. It strikes me as being better practice to start such plants in an earlyinery, or other warm house, before pruning into shape and repotting them. As soon as the plants have made shoots 2 or 3 inches in length, the cuttings may be taken. If these have a slight heel, so much the better will they root. Choose 3 inch pots, fill them with sifted leaf-mould and silver-sand, and insert six cuttings in each; plunge in the propagating-house, or in a dung-bed frame, having a bottom-heat of 80°. *Fuchsia* cuttings soon root, and as soon as they are well-rooted, turn out the pots, potting the cuttings singly into 60's, using loam, leaf-mould, and sharp sand. By repeatedly shifting the plants as they fill the pots with roots, and stopping the shoots when two joints long, well-bloomed specimens are obtained in one season. Some varieties need much more pinching at the points of the shoots than others, but to obtain a close habit of growth, plenty of flowers, and symmetry, a certain amount of pinching is needed by all. By pinching, the grower is enabled also to regulate the flowering-time of a plant, providing they are in vigorous health. The shoots should be pinched for the last time about six weeks previous to the date you wish the plant to be in flower. A good potting soil consists of good loam and leaf-mould one part each, some horse-dung from a Mushroom-bed, and sharp sand. The present is a suitable time to start plants required for showing. When a *Fuchsia* is well rooted, liquid-manure made from sheep-droppings is an excellent stimulant.

**MISCELLANEOUS ITEMS.**—Seeds of *Grevillea robusta* should now be sown, the plants coming in usefully for furnishing and various purposes towards the end of the year. *Aralia Sieboldi* is a useful plant, easily raised from seed; and as soon as seed can be had, which is in March or April, sow some in gentle heat, and grow on in warmth throughout the summer. It is a useful plant for winter work. Shading material of all kinds should be got in readiness for use forthwith.

**WOOD INDUSTRIES OF SWEDEN.**—The *Timber Trades Journal* has just issued an illustrated account of the commercial history and development of the timber trade in Sweden. The red "Fir" is the produce of *Pinus sylvestris*, the White Fir or Spruce of *Abies excelsa*. Since the abolition of the duties in 1866, the export of timber and of wood already sawn and planed, has assumed enormous proportions, and those who are fond of statistics will find plenty of them in the present publication. But little apprehension exists as to the exhaustion of the supplies, provided certain precautions be taken. Details are given as to the several timber-shipping ports, and much other information of the highest interest to those concerned in the timber trade.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER. Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

## APPOINTMENTS FOR THE ENSUING WEEK.

## MEETINGS.

SATURDAY, MAR. 14—Royal Botanic Society meet.  
THURSDAY, MAR. 19—Linnean Society meet.

## SHOWS.

WEDNESDAY, MAR. 13—Royal Botanic Society's show at Regent's Park.  
Devon and Exeter Gardeners' Association show.

## SALES.

MONDAY, MAR. 11—Azaleas, Spiræas, Fæonies, Mont-bretias, Gladioli, &c., at Protheroe & Morris' Rooms.  
TUESDAY, MAR. 17—Carnations, Herbaceous and Hardy Plants and Bulbs, &c., at Protheroe & Morris' Rooms.  
WEDNESDAY, MAR. 18—The Green Bank, Sheffield, collection of Established Orchids, by order of D. Doncaster, Esq., at Protheroe & Morris' Rooms.  
Japanese Lilies, Tuberoses, Gladioli, Greenhouse Plants, Roses, Palms, &c. at Protheroe & Morris' Rooms.  
FRIDAY, MAR. 20—Imported Orchids, by order of Messrs. Hugh Low & Co., at Protheroe & Morris' Rooms.  
Hardy Perennials, Clematis, Roses, Amaryllis, &c., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—42° 9'.

That excellent authority, M. NEUMANN, in his standard manual *Die Kunst der Vermehrung, &c. (The Art of Propagation [Plants])*, states, p. 30, third edition, "that the propagation of plants by means of sections of the stem is being followed in most countries, and that he had made use of this method in propagating *Cycas circinalis*, a plant formerly rare in gardens." He took cross sections of the stem 2 to 3½ inches thick after cutting off the crown, left them uncovered for four or five days in a warm place to allow the surfaces to dry, and then planted them in pots of a suitable size; placed these on bottom heat, and covered each with a bell-glass. These slabs soon formed roots, and shoots pushed forth between the scales. As soon as the growths had reached a proper degree of development, they were detached and employed in the same way as cuttings, which soon formed as erect, regular plants as the mother from which they were taken. NEUMANN did not doubt that similarly good results could be obtained from the roots of *Paulownia*, *Dracæna*, *Poinsettia* (*Euphorbia*), *Astragalus*, *Spathodea*, *Dieffenbachia*, *Saccharum*, *Melora*, the tree-like *Aroids*, &c. The stem is cut into pieces 1 to 1½ inch long, inserted slantingly in silver sand, if it is a kind which readily rots, or sandy earth in a hot bed; or in the case of robust kinds, in the natural soil. When the resulting growths are sufficiently developed, cut them off and use as cuttings, planting them singly in small pots, and affording them bottom-heat or not, according to their needs, until roots form, when they must be accustomed, like other cuttings, to more light and air.

The head of the *Cycas* which he had severed from the stem, was left exposed to the air for three weeks in the glass-house before it was set

in a pot, without his expecting any results, for it was a very young specimen. In the following year, however, he remarked that this crown had taken root, and growths were appearing between the scales, precisely as had occurred with the section. These growths were employed as the others had been, but they took almost a year to form roots.

Those of our readers who possess some of these noble forms of vegetation, the *Cycads*, and are desirous of increasing the number for the decoration of the apartments, dinner-tables, &c., or those whose plants are not furnished with crowns of any great beauty of form or colour, should put NEUMANN'S methods of propagation into practice. The chief points are: a propagating-pit, a steady bottom-heat of not less than 80° to 85°, and top-heat from 8° to 10° less, with a suitable degree of moisture; careful shading from direct sunshine, attention to keeping the sand or sandy earth about the sections and outtings in a uniformly moist state, and close in small frame hand-light or bell-glass placed within the pit. We know of many unwieldy and very rare *Cycadaceous* plants, which their owners would only be glad to increase in number, if they but knew the way how to do it.

THE disease known under this name is not only a plague to farmers, but to gardeners also, as Cabbages, Cauliflowers, Wallflowers, and other Crucifers, are as liable to it as agricultural crops proper. Mr. POTTER, in the *Journal of the Newcastle Farmers' Club*, records some interesting experiments made with a view of ascertaining the depth at which the spores of the fungus can retain their vitality, and of obtaining information on other points of the plant's life-history. Trenches were dug of different depths, and duly infected with the spores of the *Plasmiodiophora*. The trenches were filled in, and Turnips sown at the top of each trench. When the roots were lifted, it was found that there was no trace of the disease below 8 inches; but where the spores had been buried within 2 inches of the surface, the majority of the plants was affected. At 4 inches the proportion was less, and continued to decrease as the depth increased. In order to ascertain whether the spores had actually been killed, or merely rendered dormant by being buried beneath the soil, the infected soil in the year following from the original trenches was again made use of at varying depths as before, and again sown with Turnips. The results obtained corresponded exactly with those obtained in the previous year. Turnips grown in the soil from 2 to 4 inches in depth were badly affected; those grown in soil from trenches 6 inches deep and upwards, were not affected. The practical inference is, that deep ploughing should be effected.

Mr. POTTER'S further experiments go to show that spores of *Plasmiodiophora* can certainly retain their vitality for two years. If once the period of time required to starve out the fungus were known, then by avoiding all Cruciferous crops for this period, the disease could be stamped out provided it were not re-introduced from without. This proviso is all-important, for we could scarcely hope to banish all the Cruciferous plants in any locality; and if not, there would be no security against infection.

RHODODENDRON NOBLEANUM AT LOGAN GARDENS, STRANRAER.—One of the earliest shrubs in the year to flower in the open air—*Rhododendron Nobleanum*—is much employed in those parts of Britain which enjoy a compara-

tively warm climate in the winter, such as the south-western counties in Scotland and England. The variety has a trace of *Rhododendron caucasicum* (a late bloomer), and *R. arboreum*, and doubtless it is to the latter species that its earliness to flower and tenderness are due. The plant illustrated (fig. 46) is growing in the gardens of Jas. McDONNELL, Esq., Logan, Stranraer, N.B., and his gardener, Mr. McMECKING, who kindly sent several photographic views of the plant taken from different points of view, remarked in his letter to us "that the plant showed two or three blooms as early as January 6, this year, and was nicely in bloom on the 20th of that month." The colour of the flower is deep rose.

LINNEAN SOCIETY.—An evening meeting will be held on Thursday, March 19, 1896, at 8 p.m., when the following papers will be read: I. "On the structure of the female flowers and fruit of *Sarranga*, Hemsley (*Pandanaceæ*)," by Dr. A. STAFF; and II. "On two little-known *Ophioglyphons Snake*," by G. S. WEST.

THE NATIONAL AURICULA AND PRIMULA SOCIETY: SOUTHERN SECTION.—We learn from the report of this Society recently issued, that twelve new members have joined the Society during the year, and that the loss has been four. The increase is encouraging, but an earnest appeal is made for increased support, and lovers of *Auriculas*, *Primulas*, &c., are specially invited to join the Society. Allusion is made to the great progress made in the southern parts of the country in the cultivation of the show *Auricula*, and the excellence of the alpine varieties. On the occasion of the nineteenth exhibition held on Tuesday, April 23, 1895, the quality and quantity of plants and flowers greatly exceeded anticipation, in spite of the severe and protracted winter. The lack of gold-faced *Polyanthoses* at the show is deplored. The committee deem it inexpedient to again hold an election of the best varieties of *Auriculas* and *Primulas* now that a list of the winning flowers is published in the Annual Report. The statement of accounts shows an expenditure of £77 14s. 4d. against subscriptions £69 3s. 6d., a deficit taken from the reserve fund of a sum of £8 10s. 10d. The balance in hand equals £11 18s. 6½d.

POTATOS.—Mr. ARTHUR SUTTON has reprinted from the *Journal of the Royal Horticultural Society* the substance of his lecture on October 29, 1895, illustrated by numerous photographic reproductions of the lantern slides made use of on the occasion. It is an interesting contribution to the history of the Potato, comprising details as to the acreage under cultivation in various countries, the methods of selection and of raising seedlings, notes on the methods of preventing or palliating the disease, and the curious results obtained by grafting the Potato on to the Tomato, &c. We shall take another opportunity of alluding to this very interesting publication, which in the meantime we commend to all concerned in the culture of the Potato.

THE COOMBER TESTIMONIAL.—The committee have resolved to close the fund that is being raised for the above purpose on March 31. The amount subscribed up to the present time is £113 4s. 6d. Those friends who have promised to subscribe are asked to forward without delay to Mr. H. J. VEITCH, the Treasurer, or to Mr. J. WILLIAMS, the Secretary.

EALING GARDENERS' ASSOCIATION.—At the usual weekly meeting held on the 3rd inst., Mr. J. HAWES, gr. to the EARL OF JERSEY, Osterley Park, exhibited a fine *Cyclamen*, growing in a 6-inch flower-pot, and possessing upwards of 150 flowers of a pure white. The plant was two years old from seed, yet it had a diameter of more than 2 feet. *Pizes* offered for spring-flowering plants occasioned a keen competition in various good subjects. A paper, entitled "Horticultural Exhibitions, their Uses and Abuse," was read by Mr. C. H. CURTIS.

EVERGREEN POPLAR.—Our curiosity is aroused as to an evergreen Poplar, specimens of which were presented to the National Horticultural Society, Paris, lately, by M. GODEFROY-LEBEUF. It is said, but with a note of doubt, to come from Chili.

"BOTANICAL MAGAZINE."—The plants figured in the March number are:—

*Incarvillea Delavayi*, Bureau & Franchet. A very showy herbaceous perennial of the Bignonia family, introduced by the Abt  Delavay, from the mountains of Yunnan in Western China. The leaves are a foot long, impari pinnate, the 8—10 pinnae sessile, lanceolate, coarsely toothed; the scape is erect, destitute of leaves, and bearing at the summit three or four rose-pink flowers, each 3 to 4 inches long; calyx tubular, angular, lobes acute, corolla-tube curved, subcylindric, about 2 inches long, dilating into a flat five-lobed limb; anthers glabrous. Flowered

*Massonia jasminiflora*, Baker. A curious bulbous plant, with broadly ovate green leaves, spreading on the ground, and encircling a central tuft of white long-tubed flowers; Orange Free State; t. 7465.

*Utricularia ianthina*, Hook. fil. A Brazilian species, with long red leaf-stalks, bearing cordate, rounded, undulate, green leaves, and tall racemes of large pale violet flowers. Flowered at Kew in 1895. Introduced by Messrs. Saender; t. 7466.

**CURLED CHINESE MUSTARD.**—The *Revue Horticole* has an illustration of a new variety of this little-known vegetable. It has broad leaves, curled

"BRITISH MYCETOZOA."—Mr. ARTHUR LISTER has compiled a guide to the British species of this group (Slime-fungi), which may now be studied in the galleries of the Natural History Museum. Mr. LISTER has not only compiled the guide, but has presented the specimens and the beautiful drawings by Miss LISTER which accompany them. In addition, Mr. LISTER has enriched the Museum with a collection of more than 800 microscopic slides. The systematic portion of the Guide before us is introduced by an admirably clear account of the morphological peculiarities and life-history of these singular organisms. There have been many controversies as

FIG. 46. — BEGONODENDRON NOULEANUM AT LOGAN, ITRANRAEB. (SEE P. 332.)

at Kew in a cool greenhouse, but Mr. Thompson of Ipswich has had much greater success with it as growing in the open ground; t. 7462.

*Comantosphoe japonica*, Spencer Moore. A Japanese undershrub of the Labiate family, with lanceolate leaves and terminal crowded spikes of white flowers. It flowered at Kew in the open air in October, 1891; t. 7463.

*Dipodium paludosum*, Rehb. f. A native of marshy places in the Malay peninsula, with distichous ensiform leaves, and long-stalked lateral racemes; flowers numerous, 2 inches in diameter, straw-coloured, with purplish spots; segments oblong, lip shorter, villous; flowered at Glasnevin; t. 7464.

like those of a Kale, and of a rich green colour, so that for garnishing purposes it will be found very acceptable, while its flavour, when cooked, is said to be more delicate than that of Spinach. The seeds are sown in the open ground in early autumn, and the young plants pricked out so as to leave a space of 12 to 18 inches between the plants in each direction. Within six weeks after sowing, the leaves may be plucked, the yield continuing till the first frost. It may also be sown in spring, but when summer comes, there is a tendency to "bolt," and the leaves produced are not so fine as those developed at the end of the summer or the beginning of autumn.

to whether they should be classed with the animal or with the vegetable kingdom. It is significant of the drift of modern opinion that the present collection is entrusted to the Botanical Department, and that the Guide is published with an introductory notice by the new keeper of the department, Mr. GEORGE MURRAY. In the days when tan was more used for hot-beds than it now is, much mischief was occasionally brought about by one of these fungi, now called *Fuligo septica*. We have seen the cuttings in a long propagating-pit materially injured, or entirely destroyed, within twenty-four hours by the spread of these "flowers of tan." Powdered sulphur and salt were used to check the further progress of the enemy.

**DENDROBIUM BIGIBBUM.**—There is a note concerning this species figured in the last part of FITZGERALD'S *Australian Orchids*, which may be worth repeating:—"Captain BROOMFIELD, who has successfully grown this plant, states that this Orchid will stand more ill-treatment and neglect than any other tropical Orchid he knows of; if put up in an attic for twelve months it retains its vitality; and if afterwards put into favourable conditions of growth, it will shoot vigorously, and as if it were refreshed after a long rest."

**WINE PRODUCTION IN FRANCE.**—The production of wine in France is stated to have amounted in 1893 to 50 millions of hectolitres; in 1894 to 40 millions, in 1895 to 23 millions. This drop in production is attributed in the *Annales Agronomiques* to black-rot and mildew. At the same time, the quality of the produce was exceptionally good.

**ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.**—The directors of this Society have been successful in securing the grounds of Robert Gordon College, Aberdeen, in which to hold their annual exhibition on August 21 and 22 next.

**THE WEATHER IN THE NORTH OF SCOTLAND.**—The genial climatic conditions prevailing since the present year came in have often prompted the remark, "We will snuff for this ere long." The "ere long," however, has been long in coming. Vegetation of all kinds has responded to the beautiful weather. Spring flowers came out early, and Rose bushes are to be seen in full leaf, with here and there a bud bursting forth. Since March came in, however, most unfavourable weather for seed-sowing has prevailed—rain and sleet alternating with bright sunshine—and it is probable that these conditions will continue. The barometer is falling, and in the opening days of this week stood at 27.64 inches. The second week of January brought a series of abnormally high barometrical readings; and the first week of March has brought a series as abnormal in the opposite direction.

**LECTURE ON THE WINTER-PRUNING OF FRUIT TREES.**—On Tuesday and Thursday, 3rd and 5th inst., practical demonstrations on winter-pruning of fruit trees were given in the open by Mr. W. CRUMP, gardener, Madresfield Court. These lectures were given under the auspices of the Worcestershire County Council, before audiences consisting of farmers, small holders, and cottagers, who reside in the neighbourhood of Powick, Gnarford, Malvern, and other places adjacent. The Apple, Pear, Plum, Apricot, Gooseberry, Currant, and Raspberry, were each severally dealt with, full explanations being given of the operations, and made clear in every case. The trees and bushes operated upon were found in neighbouring gardens and orchards. In the evening of each day the course was continued in the school-rooms before a larger number, comprising many of the working-classes, who entered thoroughly into the spirit of the proceedings. Living examples of the various stages of growth of bush, cordon, and standard orchard trees were brought from Madresfield home nurseries, and the various methods of pruning explained. Examples were also shown of shoots, &c., improperly pruned, and also of unpruned bushes, &c., which created a lively interest and much profitable discussion—how to do it, and how not to do it, being thus forcibly brought into juxtaposition. A hope was expressed that other demonstrations in the art of fruit cultivation, and other matters, would be given at no very distant date.

**STOCK-TAKING: FEBRUARY.**—Notwithstanding the clouding over of the political sky during the past three months—the danger proved to be threatening from east and west, from north and south—the balance-sheet of the nation's industry for the past month is of the most reassuring nature, as full of confident promise as if all danger of rupture between this and any other nation were as far removed as is night from day. Political "aspects" we, however, must leave to politicians, and simply state that im-

ports and exports have increased over those for the same period last year; thus, the former, with a total for February of £35,476,736, or an excess of £7,342,247 over the same month last year. The imports for the past two months exceed in value those for the same period in 1895 by £9,072,622—or a total of £73,950,592. It is worthy of record that the only decrease in the value of the imports is one of £57,425 under the heading of raw materials for textile manufactures. Our usual selections from the "summary" table are as follows:—

IMPORTS.	1895.	1896.	Difference.
	£	£	
Total value of imports	28,134,489	35,476,736	+7,342,247
(A.) Articles of food and drink—duty free ... ..	8,665,372	11,400,923	+2,735,551
(B.) Articles of food and drink—dutiable	1,628,354	1,749,032	+120,678
Raw materials for textile manufactures ... ..	6,751,189	7,317,791	+566,602
Raw materials for sundry industries and manufactures ...	1,875,018	2,746,428	+871,410
(A.) Miscellaneous articles ... ..	769,201	1,125,915	+356,714
(B.) Parcel Post ... ..	65,279	93,433	+28,154

It would almost appear as if the Lyons manufacturers were content to allow Manchester men to act as middlemen in selling and exporting certain classes of productions in silk, and that the commercial princes in our great inland port were doing the same species of trade for Japanese manufacturers; certainly much trouble is saved at a low charge by the intermediary. Our old commercial-barometer friend "chemicals" indicate an increase of £296,854—an almost unheard of increase; and so we are, in a manner, prepared for the excess, in the imports of live stock (for food) of £353,711 over February, 1895—also for the excess, amounting to £566,622, in raw materials for textile manufactures. Of course, the workman's pipe makes a good show, and the value of tobacco imported last month amounted to £300,212, being £116,549 above the total for the same period in last year. The item of "manufactured articles" is this month a very large one—£1,155,902; but it includes a large amount of goods which are re-exported to all quarters of the globe. But of this enough. It is time to draw attention to the classes of fruits, roots, and vegetables which entered our ports during last month; this is shown in the following table:—

IMPORTS.	1895.	1896.	Difference.
	...	...	
Fruits, raw:—			
Apples ... .. bush.	311,062	303,864	-7,198
Cherries ... .. "	—	—	—

Onions ... .. "	391,172	481,986	+90,814
Potatoes ... .. cwt.	53,363	39,950	-13,413
Vegetables, raw, unenumerated ... .. value	£51,499	£72,713	+£21,214

It is possible that the importations of Cape fruits are lumped under the total of unenumerated fruits, and these contain Peaches, Apricots, Grapes, &c.—much of fine quality. Report speaks favourably of what is shortly to reach us from the Antipodes, for which a ready market will be found.

OUR EXPORTS

for the past month reached the very satisfactory total of £19,683,456—being £3,710,361 in excess of the total for the same period last year. The total for the two months is £40,810,624—some £6,613,293 above that for the same period last year. Textile fabrics were sent out last month to the value of £9,461,438, as compared with £8,060,324 in February, 1895; in everything else there is a large accretion—as indicated by the increase on the month recorded above—a highly satisfactory conclusion.

**STOKE NEWINGTON, STAMFORD HILL, AND CLAPTON CHRYSANTHEMUM SOCIETY.**—We learn from the secretary of this society *pro tem.*, Mr. R. JOHNSON, that in consequence of the increase of business, and of the secretarial duties in connection with this society, the honorary secretary, Mr. L. H. CALCUTT, has found it necessary to resign his office. At the same time, the treasurer, Mr. S. CALCUTT, has also resigned, feeling that the offices of treasurer and secretary in this case were in a great degree coincident. The committee, at a meeting held on February 3, elected Mr. G. PRICKETT, of the St. Ann's Road Floral Nurseries, to be treasurer, and Mr. R. JOHNSON, gardener at No. 73, Stamford Hill, to be secretary *pro tem.* The dates fixed for the exhibition to celebrate the Jubilee of the formation of the first Chrysanthemum Society in Stoke Newington, are November 11 and 12, 1896.

**ROSE SHOW FIXTURES IN 1896.**—The following additional list of Rose shows to be held during the present year has been sent us by Mr. ED. MAWLEY, Rosebank, Great Berkhamstead—the first list appeared in our issue for February 8, p. 172:—June 27 (Saturday), Canterbury; July 7 (Tuesday), Wolverhampton (three days); 8 (Wednesday), Hitchin; 9 (Thursday), Worksop; 30 (Thursday), Trentham; August 5 (Wednesday), Chester (two days). I shall be glad to receive other fixtures as soon as arranged, for insertion in my next list which will be issued early in April.

**MR. WILLIAM FALCONER.**—The position of superintendent of the extensive and well-equipped park system at Pittsburg, where are the Phipps conservatories given to the city by H. PHIPPS of the Carnegie Iron Works, and which was rendered vacant by the death of A. W. BENNETT, has been filled by the appointment of Mr. WILLIAM FALCONER, who is at present in charge of the gardens of C. A. DANA, Esq., at Glencove, L.I., N.Y. WILLIAM FALCONER, who is now in his forty-sixth year, is a native of Inverness, and after serving apprenticeship, was engaged in the laying-out of a park at Manchester. Subsequently he entered the Royal Gardens at Kew, leaving there in 1872 to join the staff of the *Garden* newspaper. He wrote a work on *Market Gardening* during that period. Two years later Mr. FALCONER went to America, and was engaged by the late F. L. AMES, of North Easton, Mass. After passing a short time in Texas in a nursery, Mr. FALCONER accepted the position of superintendent of the Botanical Garden at Harvard, under the directorship of Prof. SARGENT, who had just succeeded to the post. Here he did much valuable work, the evidences of which appeal to the visitor to-day. As a writer on horticultural matters WILLIAM FALCONER'S name is familiar to many of our readers, and he also edits our contemporary *Gardening*.

**ROYAL BOTANIC SOCIETY OF LONDON.**—It seems not to be generally known that a gardener in the employment of a fellow of the society can obtain free admission to any of the exhibitions held at the gardens between the hours of Six and Ten in the morning, before the judges go round, if an application be made by the fellow or member to the secretary, at the gardens, when passes will at once be forwarded. The first exhibition of spring flowers will take place on Wednesday next, the 13th; and as, owing to the bright warm weather we have had, many flowers are abnormally early, a more than usually varied show is anticipated.

PYRUS SORBUS.

Our illustration (fig. 47, p. 335) shows a very fine example of *Pyrus Sorbus* growing in the demene of Comte de Marrard de St. Romain at Bresse sur Groene, Saone et Loire. The height of the tree is about 16 yards, width of crown 19 yards, and circumference of bole 4 yards.

In the year 1888 this tree produced 18 hectolitres of fruit, which sold for 405 francs. We do not make use of the fruits of *Pyrus Sorbus* in this country, but on the Continent they find ready sale, and are much used in the form of preserves, or as we use Catillac and Urbanist Pears.

HOME CORRESPONDENCE.

**LARCH DISEASE.**—I am obliged to Sir C. W. Strickland for his information about the Japanese and American Larches. I know that examples of the former are now about 20 feet high in Perthshire, fifteen years planted, doing well and free from disease, which does not look as if 40 feet was this variety's maximum height, as stated by professed authorities. It is something

never saw elsewhere, the Larch grows for a while nearly 4 feet in a season, beautifully clean trees, on just the right sort of land, where the rain is about the least, just over 20 inches; yet the young plantations of Larch there, about 20 feet high, are almost the very worst diseased I ever saw, being just a mass of canker—quite a frightful spectacle. I saw them last winter, having been asked to look at them by the proprietor. In a damp river valley, near the borders of Westmoreland, where the rainfall is double 20 inches, and inland, on the limestone, I know a

the Peach, which is almost as destructive when it does set in, for Peach trees once fairly affected never recover. *J. S., W.*

**THE WEATHER.**—I have been frequently asked of late whether the temperature of the past winter has not been unprecedentedly mild, but the following statistics prove that such an impression is unfounded. During the past twenty-one years there have been six milder winters recorded here, and it may be as well to mention that meteorologists consider the winter to comprise the period from the first day of December in the one year to the last day of February in the next:—

Mean Temperature of Winter.					
1873-74	...	39.6°	1882-83	...	39.6°
1876-77	...	42.0°	1883-84	...	40.0°
1877-78	...	39.3°	1895-96	...	38.8°
1881-82	...	39.0°			

The mean temperature of winter is 37.1°, so that the winter of 1895-96 has only been 1.7° milder than the average, but as much as 5.2° colder than that of 1876-77. With respect to the rainfall, I may remark that although the amount for December was nearly 1 inch above the average, yet for January and February it did not amount to one-third of the average for those two months. The total rainfall for the three winter months was 6.20 inches, which is 3.27 inches below the average of twenty-four years. *C. Leeson Prince, The Observatory, Crowborough Hill, Sussex.*

— I cannot call to mind anything approaching the temperature now prevailing at night—on Sunday night, March 8, the thermometer never went below 47°. Is this not most unusual? *Charles Noble, Bagshot.*

**ORIGIN OF GARDEN CINERARIA.**—I see you reproduce from the *Revue Horticole* the statement that the present garden Cineraria is the result of a cross between *Senecio cruentus* and *S. populifolius*. The *Revue*, as a matter of fact, expresses itself more guardedly, and only says that this was '*l'opinion prédominante à cette époque*,' i.e., July of last year. I have not the smallest hesitation in ascertaining that there is no trace whatever of *S. populifolius* in the present Cineraria, or any ground for believing that there ever has been. In saying this, I do not assert that this particular cross has never been effected; but I do assert that none of its progeny, so far as I can ascertain, is in cultivation now. When *S. cruentus* is actually crossed with one of the shrubby species, the effect is unmistakable. *W. T. Thiselton Dyer.*

**HARDY FERNS.**—Mr. Chas. T. Drury evidently considers the subject of hardy Ferns slightly exaggerated by me, on p. 242. I regret having given that impression; it was quite unintentional. What was in my mind when I stated "There is no place too bleak or exposed for them," is a wall in a very exposed position here, covered with Ceterach, *Asplenium Ruta-muraria*, *A. adiantum-nigrum*, *Scolopendrium vulgare*, and *Polypodium vulgare*, where nothing else will grow; if these grow only 'in a certain rugged fashion,' it is certainly better than a naked stone wall. I should like to remind Mr. Chas. T. Drury that my paper was written expressly for a Devonshire Association of Gardeners. Although the suggestions I gave hold good generally, they are more applicable to the county of Devon, and in the passage referred to, it would have been wise to have said so. I was simply recording my own experience. I fully endorse all that Mr. Chas. T. Drury says with regard to the more delicate and tender varieties. I think he would be much surprised at the vigorous health and beauty of many varieties we have here. Had I been aware my paper would have been published, I should have been more explicit. *J. D. N.*

FIG. 47.—PYRUS SOBUS: THE TRUE SERVICE TREE. FRUITS PEAR-SHAPED OR OBOVATE.

to know also that one of the American Larches grows as well as the Swiss Larch. In the States I understand it is a valued timber. I cannot venture to answer your correspondent's query as to what are the conditions that influence the Larch disease, but he might consult Prof. Marshall Ward's book on the subject, where the spread of the disease is, I think, correctly explained from Hartig's researches. I have seen the disease badly in the most diverse situations in England and Scotland, as regards climate and rainfall. On a certain estate in Norfolk, not far from Sandringham, where all the Firs thrive amazingly, and where the foliage of the Scots Fir has a lustre I

nearly equally bad example of the same age, and many others, under the most diverse conditions. As I said before, it resembles the Potato disease in its general distribution. My opinion is, that the disease will extend to all the young plantations mentioned by your correspondent. Those who hold that the disease is the mere product of certain unfavorable conditions of soil or climate, or both, have plenty of riddles to solve in that respect, and plenty of opportunities for finding out whether their theories are correct or not. Why then indulge in conjecture? The canker of the Larch has always appeared to me to greatly resemble "gumming" in

**DEATH OF A GARDENER IN ABERDEEN FROM VEGETABLE POISONING.**—A sad case of poisoning occurred in Aberdeen on Friday, 8th inst., the victim being a gardener named James Cooper Robertson, thirty years of age, residing in Mount Street, Aberdeen. Mr. Robertson, it appears, was engaged digging near Allendale Cemetery, in the course of the morning, and while at work he turned up a root which he mistook for *Hieracium*, and ate some of it. Immediately afterwards he became ill, and, in view of the serious symptoms he felt, went home. A medical man was summoned, but in spite of the remedies prescribed, the man died within twenty minutes of his arrival home. It is surmised that the root partaken of was that of a species of *Aconite*. *[But how could a gardener make such a mistake? Ed.]*

## Scientific Committee.

Present: R. MCLACHLAN, Esq., in the chair; and four other members.

The minutes of the last meeting were read and confirmed.

A further specimen of a diseased trunk of a Peach tree was sent from Chiswick. The bark was covered with exudations of gum, and spotted all over with the expelled excreta of a small caterpillar, which was found burrowing under the bark, and penetrating only a very short distance into the wood. The insect was found to be the larva of *Semasia Weberana*, the Apple or Pear tree Bark Moth. It was suggested that a plaster of clay mixed with paraffin, and applied to the trunk of the tree, might prove a remedy—or rather, a prevention. As the insect never penetrates to any great depth, it was thought that the trees would survive many years, even when seriously affected.

Specimens of Carnations sent from M. Petras, Givao's Grove, Leatherhead, were found to be affected with a fungoid disease attacking the main stem. They were referred to Dr. Masters for identification of the fungus, but it was not thought that any practical remedy could be suggested other than burning the affected plants and starting fresh ones on fresh soil.

Mrs. Miller, of Winestead Rectory, Hull, sent blossoms of *Crocus* and *Helletorus* for identification; Mr. Veitch offered to endeavour to do this.

Mr. Godefroy Lebeuf, of Paris, exhibited some sprays of metallised *Odontoglossum crispum* with foliage of Ivy and *Eunymus*. They were beautifully executed, the natural form of the flowers being admirably preserved, and the venation, &c., of the leaves perfectly distinct.

## Floral Committee.

Present: W. Marshall, Esq., in the chair; with Messrs. Joo. Fraser, John Laing, Chas. T. Druey, H. Herbet, Robt. Owen, Geo. Stevens, Jas. Hudson, John Jennings, O. J. Salter, Thos. Peck, Geo. Gordon, G. H. Egleheart, Chas. E. Pearson, H. Briscoe-Irooside, Chas. E. Shea, J. D. Pawle, J. T. Bennett-Poe, E. Beckett, H. J. Jones, C. Blick, Jas. Walker, H. B. D'Gimbrain, Geo. Paul, Ed. Mawley, J. Fraser, and H. Turner.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, exhibited a capital group of *Cyclamens*, the plants being remarkable for the size and beauty of the flowers (Silver Flora Medal).

Another collection, in which the plants were very numerous, was from Major JOCKEY, Sunningdale Park, Ascot (gr., Mr. Thorne) (Silver Banksian Medal).

A great plant of *Cyclamen Giant White* was shown by W. M. BULLIVANT, Esq., Beckenham (gr., Mr. Crosswell). The plant was in a 9-inch pot, and carried extraordinary foliage and flowers.

A beautiful display of *Cyclamens* was made by the CHURCH ROAD NURSERY CO., Haawell, W., who had a large collection of well-grown plants, very freely flowered.

From the Earl of JERSEY, Osterley Park, Isleworth (gr., Mr. Hawks), a smaller collection of *Cyclamens* displayed very successful cultivation, some of the plants bearing a remarkable number of blossoms (Silver Banksian Medal).

*Cinerarias* were very extensively shown at this meeting, and the collections were of excellent merit. Messrs. J. JAMES & SON, Woodside, Farnham Boyal, Slough, had a group of dwarf-habited plants, just commencing to bloom, only a few flowers on each being fully developed. They indicated, however, a very high-class strain (Silver Banksian Medal).

The collection from Messrs. CANNELL & SON, Swanley, Kent, was of large extent, and the plants bore good trusses of open blossoms. There is little necessity for buying named varieties of *Cinerarias*, providing the strain is good, but we noticed *Crimson Velvet*, *Miss Sybil May* (white), *Lady E. Dyke*, rosy-crimson, with white band round disc, and *Mrs. Jackson*, purple, with white band, among others, as being good varieties in the several colours (Silver Banksian Medal).

Mr. Jno. R. Box, West Wickham and Croydon, exhibited a collection of *Cinerarias*, also worthy of remark by reason of the merits of the strain and cultivation exhibited (Silver Banksian Medal).

Of the miscellaneous groups of plants was one arranged and exhibited by Messrs. JOHN LAING & SONS, Furret Hill Nurseries, London, S.E. This was very bright and attractive. Of many plants of interest included were *Acacia cordata*, a dense small-flowering species with pale lemon-coloured blossoms. *Ficus Canoni*, a purple-leaved variety, not frequently seen; *Boronia megastigma*, a few Orchids in flower, and some well-grown *Sonchilias*. Some capital *Caladiums*, such as *Louis van Houtte*, *Comte de Germiny*, and others, were in full leaf (Silver Banksian Medal).

Messrs. JOHN FEED & SONS, Roupell Park Nurseries, Norwood Road, London, S.E., staged a small group of plants, including *Cliveias*, *Eriolas*, and *Begonia Gloire de Sceaux*, in flower, and some useful decorative foliage plants (Bronze Banksian Medal).

From Messrs. J. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, S.W., were shown the following:—*Loropetalum sinense*, bearing their paper-like white flowers; *Amygdalus persica magnifica*, *Olearia nitida*, *O. nummularifolia*, *Senecio rotundifolius*, a species with pubescent stems and foliage, very silvery on the under surface; *S. Greyii*, *S. compacta*, a plant of *Pieris* (*Andromeda*) *japonica* in flower; small plants of *Kodocarpus totara*, and *Pseudopanax forax*. Messrs. VEITCH had also a number of good *Hippocrepis* trunks in flower, and flowering sprays of their

greenhouse *Rhododendron* hybrids. The same firm was recommended an Award of Merit for *Pteris Foultoni*, a variety producing froods (about 2 feet high) with slender pinne, very graceful for decorative purposes or for cuttings. An excellent collection of plants, representing the blue-flowering strain of *Primrose* of Messrs. Veitch, was likewise shown (Silver Banksian Medal); and a large number of blossoms of *Primula sinensis fimbriata* in single and semi-double varieties.

Mr. E. G. VAN TUBENGEN, Juv., Haarlem, sent sprays of *Lachenalia Cranston Gem*, with robust stems, and large yellowish-green flowers (Award of Merit).

F. W. MOORE, Esq., Botanic Gardens, Glasnevin, sent a spray of flowers of *Rhododendron grande*, with creamy-white flowers, lilac at base (Vote of Thanks).

Mr. G. NORRIS, of the Royal Gardens, Osborne, sent a bunch of unnamed *Violets*.

Mr. CHAS. TURNER, Royal Nurseries, Slough, showed a magnificent plant of *Richardia* × *Elliotiana*, which finely exhibited the spotted character of the leaves, and the large richly-coloured yellow spathe (Cultural Commendation).

Roses were exhibited by Mr. GEO. MOUNT, Canterbury, who had four large boxes furnished with bright well-coloured blossoms of a considerable number of varieties (Silver Flora Medal).

An exhibit from the gardens of W. F. SMITH, Esq., M.P., Greendale, Henley-on-Thames (gr., Mr. H. Perkins), contained a few seedling *Hippocrepis* of considerable merit. One of these named *Lady Winifrid Gore*, a crimson variety, was recommended an Award of Merit. *Epigaea repens* and *Shortia galericifolia* were also exhibited well in flower (Vote of Thanks).

Messrs. PAUL & SONS, Cheshunt, made an exhibit of hardy plants, including some capital-flowered *Saxifraga* (*Megasea*) *Stracheyi* (First-class Certificate). The plant is not new, being very well known for its showy pink flowers. There were also many other varieties of *Saxifraga*, including a pair of *S. oppositifolia major*, which had larger flowers than the type (Award of Merit). *Primula floribunda* and other species were noticed, also a good display of *Hepaticas*, some *Hippocrepis*, and a few blossoms of *Polyantha* *Roses* in variety. Messrs. PAUL had in addition a few well-flowered plants of *Cyclopogon cristata alba*.

The largest number of *Defodilia* in bloom was exhibited by Mr. T. S. WARE, Hale Farm Nurseries, near Tottenham, who had a good collection of plants in pots in a few varieties. *Primulas*, *Saxifragas*, *Iris* of the reticulata group, and other hardy flowering plants were also shown from this establishment (Silver Banksian Medal).

Messrs. BARR & SON, King Street, Covent Garden, London, W.C., also exhibited a collection of hardy plants and flowers. Several species of *Cyclamen* were included, *Narcissus cyclamineus*, several pretty *Saxifragas*, *Chionodoxa Lucidiflora*, *C. Allei*, *C. sardensis*, and some strikingly pretty varieties of dwarf *Iris*. *Tulipa violetta*, the new species which has proved to be the earliest flowered of all in English gardens, was also exhibited (Bronze Banksian Medal).

J. T. BENNETT-POE, Esq., exhibited a fine large plant of *Asparagus sprangeri*, which, although not a flat-leaved kind, is an extremely useful and decorative plant (First-class Certificate).

Messrs. Wm. PAUL & SONS, Waltham Cross, exhibited, and were recommended an Award of Merit for, *Cupressus Lawsoniana filifera*, a graceful-habited plant, about 6 feet high as shown.

Mr. ANTHONY WATERER, Koap Hill Nursery, near Woking, staged a large plant in flower of *Pieris japonica*.

A display of *Hycinths* and *Tulips* in pots, such as is seldom seen in this Hall, was made by Messrs. Wm. CUTBUSH & SONS, Highgate Nurseries, London, N., who had large and good collections of both of these spring-flowering bulbs in extensive variety (Silver-gilt Banksian Medal). Messrs. CUTBUSH & SONS had also a few hardy plants, including *Tree Peonies*, *Iris*, *Scillas*, *Hepaticas*, *Epimedium planatum*, and a splendid lot of blossoms of the *California Violet*, which were much admired on account of their large size and unusual fragrance (Silver Banksian Medal).

From the Baroness BURDETT-COUTTS, Highgate (gr., Mr. Willard), were sent a few fine plants, about 3 feet high, and well-flowered, of *Begonia Gloire de Sceaux* (Cultural Commendation).

B. HOOKE, Esq., The Towers, Hillingdon, staged a collection of cut blossoms of varieties of *Hellebore* (Vote of Thanks).

Mr. W. BULL, New and Rare Plant Establishment, King's Road, Chelsea, exhibited some very pretty plants of *Licuala grandis*, *Geonoma acutula*, both rare and beautiful specimens of *Palm*, *Croton Prince of Orange*, and *Craun Moorei variegata*. Also a few *Clivias* in bloom.

A fine large group, on the floor, of plants in bloom was staged by Messrs. W. CUTBUSH & SON, Highgate, N., for which a Banksian Medal was awarded. The contents of the group consisted chiefly of forced hardy plants, such as *Staphylea colchica*, *Oxyria Labrumum*, *Lilac*, *Azalea mollis*, *Choisya ternata*, double white *Thorn*, &c., set off by a background of *Palms*. We remarked some well-flowered examples of the now rare *Boronia serrulata*, a plant having flowers of a cheerful bright rosy-pink colour.

Messrs. W. PAUL & SON, Waltham Cross, had a large group to correspond on the other side of the entrance to the hall, consisting of choice varieties of *Camellia japonica*, generally well bloomed, and in the finest condition. The group of plants was fronted by an admirable collection of cut blossoms arranged in show boxes. A Silver-gilt Flora Medal was awarded.

**SOME METHODS OF PLANT-PROPAGATION.**—Your correspondent, "Experience," in the issue for February 29 (pp. 270, 271), states that winter or inside grafting has been adopted by continental nations for a long time; well, and so it has in this country. My experience takes me back to fifty years ago, when *Camellias* were both inarched and grafted yearly, and I assisted in both operations; and I well remember assisting in grafting a quantity of *Roses*, only they were not treated the same as we do now. In the case I refer to, the stocks were lifted out of the ground in autumn, and heeled in until the time for grafting came round, when, after grafting, they were planted in a pit prepared for them, with manure and leaves for bottom-heat. The experiment was not very successful, but it goes to prove that our propagators were at that date conversant with the system. *Azaleas* were then also grafted; and the following gardeners, Messrs. Faulkner at Cheam House, Green at Lower Cheam, and Carson at Nonuch Park, Cheam, were exhibiting Indian *Azaleas*, all grafted by themselves, the first-named being the pioneer of the method. These plants must have been grafted sixty or more years previously, for in 1854, when I made the acquaintance of these exhibitors, the specimens were of immense size, and one, *A. i. variegata*, was worked on a stock 4 feet high, and being of a drooping habit, it grew downwards to the pot, and formed a splendid column, the stock used being the variety *Phœnicia*. Coming to a later date, the Rollions of Tooting grafted great quantities of *Azaleas* every year, and when the final sale of their nursery stock took place, thousands were sold which were all their own working. Observer.

**EARLY NESTING.**—In regard to this matter, will you allow me to state that a neighbour of mine discovered the nest of a titmouse, with nine eggs deposited therein, on February 27 last. A robin in my garden also completed its nest about that date, and now has a set of eggs. W. D. Willoughby, Ashleigh, Woodford.

**POLYPORUS ULMARIUS.**—In an out-of-the-way corner of the grounds at Dunrobin Castle, where some improvements are proposed to be carried out shortly, I found growing on the stump of what had been a very large Elm tree a fine specimen of the fungus *Polyporus ulmarinus*, which measured 3 feet in one direction by about 20 inches in another. It is hard in texture, the under part a soft creamy colour, with occasional openings, which appear to allow of the escape of moisture which may collect on its surface. The upper side is of a brownish-red colour, brightest near the edges. This is the largest specimen I have seen. Are specimens of this size unusual? and is it worth preserving? [Such large specimens are not common. Ed.] D. Melville, Dunrobin Castle Gardens.

**ROSA MULTIFLORA, DWARF FORM.**—It may interest some of your readers to hear my experience of *Rosa multiflora* dwarf perpetual, about which you had an article last season, under the heading "A Precocious Rose." On December 31, 1895, we sowed the contents of twenty seed-pots; and on February 25, 1896—that is, under two months—one of the plants had a good healthy flower-bud. The plant is under 4 inches high. The seed was not sown in strong heat, and the plants have been grown along with our *Rose* stocks. For the middle of winter this is phenomenal for *Rose* seedlings in my experience, and shows the extraordinary precocity of this variety. Pope & Sons, King's Norton, Birmingham.

## SOCIETIES.

## ROYAL HORTICULTURAL.

MARCH 10.—On the occasion of the meeting of the Society at the Drill Hall, Westminster, on Tuesday last, there was an unusually large display of exhibits, and the several Committees had each some novelties submitted before it worthy of recognition. Though the bulk of exhibits with which the Fruit Committee had to deal was only small, as many as three First-class Certificates and an Award of Merit were recommended by that body. The great majority of the collections were of such a nature that the Floral Committee deal with, and the work lasted considerably longer than usual. Orchids, too, were largely shown, and many interesting novelties were included in the several groups. Indeed, the hall was well filled, and there was a good attendance upon the committees.

## Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. M. Follett, H. Ballantine, W. H. White, John T. Gabriel, Thos. Statter, H. J. Chapman, T. W. Boud, H. Williams, E. Ashworth, E. Hill, Jas. Douglas, A. H. Smees, W. H. Protheroe, and T. B. Haywood.

A most extraordinary display of Orchids was made at the meeting, some very fine groups being staged, and some eighty subjects entered to go before the committee.

The prettiest and most effectively-arranged group was one from Sir TREVOR LAWRENCE, Bart., Burford, Dorset (gr., Mr. W. H. White), and for which, compared with other awards, the Silver Flora Medal seemed almost inadequate.

Among the more remarkable plants in the group were *Cymbidium* × *Lowio-eburneum*, which, shown with the *C. × eburneo-Lowianum*, which is the reverse cross, demonstrated by its large wax-like flowers, with purple markings on lip and column, how much finer a thing the Burford novelty is. In form it resembles *C. × eburneo-Lowianum*, but in clearness of colour, size, and all other particulars, it is very distinct, and was awarded a First-class Certificate. The Burford crosses of *Dendrobium*, too, showed up well: *D. × The Pearl*; *D. × Thalia* (*Ainsworthii* × *nobile nobiliss.*); *D. × Chio* (*splendissimum grandiflorum* × *Wardianum*) (Award of Merit); *D. × Enterpe*; *D. × Luna*; *D. × meluoducis*, and others of that class, and the varieties of *D. nobile* and *D. Ainsworthii* being the most effective. Among the *Cypripedium*, *C. × barbato-bellatulum* (*barbatum* Warneri × *bellatulum*) was certainly the brightest of the "Chas. Richmond" class; *O. × caloso-bellum* resembled the handsome *O. × Olenus*, illustrated in the *Gardener's Chronicle*, May 18, 1895; and *O. × Conco-Lawre*, variety *Janus*, was a most extraordinary bizarre, the lip, one petal, and half the upper sepal, being of the usual rose-purple colour; while the other petal and half the upper sepal were yellow and white, veined with green. A pretty hybrid in this group was *Laelio-Cattleya × Thetis* (*L. × exoniensis* × *L. pumila*); and another elegant plant raised at Burford was *Dendrobium* × *specio-Kingianum*, which bore several sprays of white flowers. Among plants showing very good culture were a splendid mass of the pretty natural hybrid, *Brasso-Cattleya* × *Lindleyana*, with eighteen flowers (*Cultural Commendation*); *Miltonia* × *Bleuana nobilior*, *Epidendrum* × *Endresio-Wallisii*; two plants of the noble *Cattleya Trianaei* *Leanae*; *Calanthe Stevensii*, *Cypripedium Rothschildianum*, &c.

Messrs. JAS VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, likewise staged a magnificent group, in which their new *Epidendrum* × *elegantulum* (*Endresio-Wallisii* × *Wallisii*?) was a most beautiful addition to garden cross-bred Orchids. It has the neat habit of *E. × Endresio-Wallisii*, but the flowers, which are large, like *E. Wallisii*, and have the segments very flatly displayed; the sepals and petals having a whitish area at the base, the rest pale yellow, beautifully coloured with red-brown over the greater part of their surface. Lip white, with a yellow base, and a few rose-coloured spots on the base (First-class Certificate). Another pretty hybrid, *Laelio-Cattleya* × *Doris* var. *xantho* (*L. harpophylla* × *C. Trianaei*?), of a remarkable light orange-colour, in form resembling *L. C. vitellina* (illustrated in the *Gardener's Chronicle*, March 25, 1893), received an Award of Merit; and *Dendrobium* × *Cybele nobiliss.*, *D. × euryalus*, *D. × Eneas* (*crystallinum* × *japonicum*?), were noteworthy. The group was made up with *Phalaenopsis Aphrodite*, *P. × Vesta*, a pretty pink-spotted *Anguloa*, which will probably be the one known in gardens as *A. Turneri*; *Dendrobium atro-vinaceum*, several plants of *Cymbidium* × *eburneo-Lowianum*, *Coleogyne cristata alba*, *Lelia glauca*, varieties of *Cattleya Trianaei*; many hybrid *Cypripediums*, *Dendrobiums*, &c. (Silver Flora Medal).

NORMAN C. COOKSON, Esq., Oakwood, Wylam-on-Tyne, Northumberland (gr., Mr. Wm. Murray), sent the original *Laelio-Cattleya* × *Doris* (*L. harpophylla* × *C. Trianaei*?), which first flowered with him early in 1891. Its flowers are light Indian-yellow, or orange with purple band, and white margin to the lip (Award of Merit); also *Dendrobium* × *Doris* (*Lechianum*? *moniliformum*?), a very pretty white hybrid cross of the *D. × Cassiope* class (Award of Merit); *D. × Cassiope virginalis* (Award of Merit); *D. × Dulce*, Oakwood variety (*avreum* × *Linawianum*), a charming rose-tinted form, similar to that raised by Messrs. Veitch (Award of Merit); *D. × Kenneth* (*Beasoniae*? *McCartiae*?), a charming hybrid, with delicately-tinted flowers (Award of Merit); and *D. × Harold* (*Fiadlyanum*? *Linawianum*?).

Messrs. F. SANDER & Co., St. Albans, were awarded a Silver Banksian Medal for a very effective group of Orchids, in which the handsome cross-bred *Phaius*—*P. × Cooksoni*, *P. × amabilis*, and *P. × Martha* were prominent. Among other showy things were *Dendrobium Donnesiae*, *Angreum Humboldtii*, *Spathoglottis Kimballianum*, *S. Lobbi*, *Angreum sesquipedale*, *Lycaste Skinneri* *leucoglossa*, *Odontoglossum Pescatorei*, *O. Wilckeanum*, *O. crispum xanthinum*, *O. luteo-purpureum*, *Vanda Bensoni* *anchorifera*, *Coleogyne cristata alba*, the curious *Dendrobium glomeriflorum* (Botanical Certificate), the pretty *Maxillaria sanguinea*, various *Dendrobiums*, *Cypripediums*, &c. Messrs. SANDER also showed plants of the fine pink-spotted *Anguloa*, flowered out of their importation, which was provisionally named *alba magna*.

THOS. STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed a fine representative group of *Dendrobiums* of the season, remarkable for their excellence and good culture. Among them were *D. × splendissimum giganteum*, *D. nobile Statterianum*, *D. n. Amesiae*, *D. × Holfee*, &c. (Silver Flora Medal).

CHAS. WINN, Esq., Selly Hill, Birmingham (gr., Mr. Armstrong), also showed a remarkable collection of *Dendrobiums*, among which were eight hybrids raised at Selly Hill, and all with excellent flowers. Also *D. Wardianum*, Uplands variety, noticeable for the very large blotch on the lip; and *Cattleya Trianaei*, Uplands variety, also good. A Silver Banksian Medal was awarded for the group.

DE B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed *Cattleya Trianaei* *Crawshawiana*; the best and richest-coloured *C. Trianaei* shown this season, the varying tints of crimson, purple and magenta in the showy labellum of its finely-formed flowers being of indescribable richness (Award of Merit).

Sir FREDERICK WIGAN, Clare Lawn, East Sheen, Richmond (gr., Mr. W. H. Young), showed a magnificent plant of *Miltonia Roezlii* splendens, with rich purple blotches on the petals of its fine flowers, of which it bore twenty-eight, two of the spikes having five flowers, and three four (*Cultural Commendation*); also *Dendrobium* × *Wiganiae* (*signatum* × *nobile*?), which had pretty pale primrose flowers with a purple blotch on the lip; a fine pan of *Coleogyne sparsa* and *Selenipedium* × *Perseus* (*Lindleyanum* × *Sedeni porphyreum*).

Messrs. HUGH LOW & Co., Clapton, arranged an effective group of Orchids, chiefly *Dendrobiums*, among which were *D. primulum*, *D. nobile*, *D. crassinode*, *D. Hildebrandii*, *D. Findleyanum*, *D. superbum*, *D. Phalaenopsis*; also *Cymbidium Lowianum*, *Odontoglossum*, *Cattleya*, &c. (Silver Banksian Medal).

W. VANNER, Esq., Camden Wood, Chislehurst (gr., Mr. Robius), was awarded a Silver Banksian Medal for a very pretty group of Orchids, in the centre of which was the magnificent *Odontoglossum crispum Arthurianum*, a grandly-blotched flower quite in the first rank of spotted *crispums* (First-class Certificate); *O. Wilckeanum*, *Calanthe Regnierii*, varieties of *Cattleya Trianaei*, *Phaius* × *Cooksoni*, *P. × Martha*, *Coleogyne cristata Lemoniana*, *Cypripedium* × *Calypso*, and other *Cypripediums*, and the pretty yellow *Dendrobium velutinum* (Botanical Certificate).

Baron Sir H. SCHRODER, The Dell, Egham (gr., Mr. H. Ballantine), as usual, displayed some of his fine things, among those most admired on this occasion being The Dell *Calanthe* × *Baron Schroder*, of which the wholly rosy-purple dark form is the finest known *Calanthe*. A lighter variety of it was also shown, and a spike of the purple-blotched *Odontoglossum Pescatorei* *Veitchianum*, *O. crispum Rex*, *O. coronarium*, &c. (Silver Banksian Medal).

Mr. JAS. CYPHER, Cheltenham, staged a splendid group of *Dendrobiums*, among which *D. nobile Cypheri*, *D. × Rubens*, *D. × Ainsworthii*, *Cypher's* var., and others raised at Cheltenham were prominent. In front were trusses of *Epidendrum xanthinum*, *E. evecutum*, *E. rhizophorum*, *E. × O'Brienianum*, and pretty plants of *Odontoglossum blandum* (Silver Banksian Medal).

WELBORE S. ELLIS, Esq., Hazelbourne, Dorking (gr., Mr. Masterton), showed a grand specimen of *Coleogyne cristata alba* (*Cultural Commendation*).

ELIJAH ASHWORTH, Esq., Harefield Hall, Wiltshire, Cheshire (gr., Mr. Holbrook), showed for the first time *Dendrobium* × *Findleyano-Wardianum*, a graceful cross, showing unmistakably its parentage.

The Honble. WALTER ROTHSCHILD, Tring Park, Tring, sent *Cypripedium* × *Morganae* from one of the original plants.

F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent *Oncidium sallabundum*.

C. J. LUCAS, Esq., Warham Court, Horsham (gr., Mr. Duncan), showed a fine plant of *Dendrobium Kingianum* (Botanical Certificate and *Cultural Commendation*), *Cyrtopodium punctatum*, and other Orchids.

Mr. WM. BULL, King's Road, Chelsea, S.W., showed the fine white *Lycaste Skinneri* *alba grandiflora*, and the pretty *Cattleya Fraseri gemma*.

A. WARBURTON, Esq., Vine House, Haslingden, sent *Dendrobium nobile Warburtonianum*.

Messrs. B. S. WILLIAMS & Son, Upper Holloway, sent *Catssetum discolor*.

E. DE Q. QUINCEY, Esq., Oakwood, Chislehurst, sent the very fine *Cattleya Trianaei*, *Quincey's* variety.

PAULIA RALLI, Esq., Otlands Park, Surrey, sent a small species of *Sobralia* and two *Odontoglossums*.

G. W. ROWE, Esq., Claremont Drive, Timperley, Cheshire, showed *Dendrobium nobile Amesiae*. The Hon. Mrs. PACKENHAM, Fordingbridge (gr., Mr. A. Church), showed varieties of *Cattleya Trianaei*.

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell, sent *Cypripedium* × *Wottoni* (*callosum* × *littletulum*), and *O. × Wynneanum* (*villosum* × *Druryi*).

Mr. A. A. FEETERS, St. Gilles, Brussels, showed *Zygopetalum* × *Perrenaudii* (*intermedium* × *Gauthieri*), a splendid hybrid, with the sepals and petals greenish, barred with brown, and the large showy lip of an intense violet-blue (Award of Merit). *Miltonia* × *Bleuana*, *M. × Bleuana nobilior*, and *M. × Bleuana aures* all good, the last-named having clear yellow markings at the base of the lip. It received a First-class Certificate; also *Cypripedium* × *Barrisianum* *viriosum*.

C. J. CROSFIELD, Esq., Glodhill, Sefton Park, Liverpool (gr., Mr. Thos. Barkley), sent *Cattleya Trianaei* *alba* "Mr. C. J. Crosefield," a very finely-formed flower.

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed *Cypripedium* × *viridiflorum* of unrecorded parentage, and not great beauty.

J. W. ARKLE, Esq., Holly Mount, Derby, sent *Cattleya Trianaei* *Arkleana*, a very fine and richly-coloured form.

## Fruit and Vegetable Committee.

Present: T. Francis Rivers, Esq., in the chair; Geo. Bunyard, Jas. Cheal, James H. Veitch, Henry G. Pearson, P. C. M. Veitch, A. F. Barron, T. J. Saltmarsh, A. H. Pearson, J. Wright, Alex. Dean, John A. Laing, W. Bates, G. H. Sage, Geo. Wythes, F. Q. Lane, O. Reyolde, J. Smith, and H. Balderson.

The chief exhibit of fruit was a collection of Apples in about twenty-eight varieties, shown by Mr. Parker, gr. to the Duke of RICHMOND AND GORDON, Goodwood, Sussex. The fruits were in excellent condition for so late a season, particularly such varieties as Ribston Pippin, Scarlet Pearmain, Royal Russet, Hoary Morning, Blenheim Orange, &c. (Silver Banksian Medal). A dish of fruits named Lincolnshire Reinette, considered new by the committee, was recommended an Award of Merit. The fruit is medium in size, yellow, prettily streaked with red on one side only; stem set in a narrow, rather deep cavity, and eye very shallow, and almost closed. Its merits as a late table fruit are considered high. There being no authority for the name Lincolnshire Reinette, it is the intention of Mr. Parker to call the variety Goodwood Pippin.

A First-class Certificate was awarded to a capital dish of Blue Pearmain Apples, shown by Mr. JNO. WATKINS, Hereford.

Two First-class Certificates were awarded to varieties of Cucumber. The 1st of these is Frogmore Prolific, raised by Mr. O. THOMAS, in the Royal Gardens, Windsor, from Rockford's Market and Lockie's Perfection. The fruits are very fine, of a dark green colour, they have very shapely handles, and are sparsely studded with prickles. The other one which received a similar award, was a variety named Marvel, exhibited by Mr. S. MORTIMER. Two plants were shown each in a large pot, and each bore half a dozen first-class Cucumbers, perfectly smooth, and good in every way. A number of cut fruits of same were also shown.

Mr. J. STEVENS, Clayton Nurseries, Hassocks, Sussex, again exhibited the Strawberry Stevens' Wonder.

Messrs. HARR & SON showed Barr's Variegated Kale, improved garnishing; and Mr. Geo. Wythes, gr. to Earl Percy, Syon House, Brentford, showed *Syon Hardy Sprouting Kale*, obtained from a cross between *Asparagus* and *Cottagers' Kale*, and also a bundle of good *Asparagus* heads, cut from the open.

## A Lecture on the Melon

was delivered in the afternoon by Mr. BARKHAM, who commenced the subject by giving a few particulars relating to the history of the plant, and its introduction into Britain. He had, in very exceptional seasons, ripened fruits of the Melon out of doors, but usually they could only be cultivated in this country under glass. The following hints upon cultivation were given: Sow seeds early in January for first crop, in 60-size pots, thoroughly clean and well cracked. A compost of loam, leaf-soil and sand may be used, and one seed only placed half an inch deep in each pot. It is very important during the early months of the year that the seed be surrounded with sand. The pots may be plunged in a hot-bed of 70° to 80°, and as soon as the plants appear they must be at once removed to a very light position near the roof-glass. For pit or frame culture the plants should be stopped after the second rough leaf. Ripe fruits of good quality may be cut from successional plants from May to October. The most suitable loam was undoubtedly the top spit from an old pasture, but as this is not procurable by all, the lecturer added that he had succeeded well with good, strong, yellow loam inclined to clay. Materials for mixing with this were broken plaster or old mortar rubble, and leaf-soil. No manure should be added, the lecturer remarking that many mistakes were made in this detail. A good hot-bed should be composed of Oak and Beech leaves and stable-manure. Make it 2 or 3 feet deep, according to circumstances. On this should be placed some fresh-cut turves 2 inches deep, with grass-side down. The soil should be allowed to remain in the house or pit until it is warmed, then planting may be done. The ridge system rather than a flat surface is to be preferred. Care must be taken not to water the border near the stem. Plant thinly that no over-crowding may result, and regulate the growth so that there will be just sufficient healthy foliage to furnish the trellis and no more. Shoots not required may be removed with thumb and finger. The stopping of the laterals and the sub-laterals must be done very carefully, and at the proper time. Never use a knife, but always the thumb and finger. The plants being dioecious, there are male and female flowers on each plant. In bright weather in mid-season the flowers may become fertilised without interference, but it was the general practice to make sure of a "set" by taking pollen from the male blossom to the female blossom, or by removing the male blossom entirely, and inserting it into a female blossom. This should be done during the brightest period of the day. The syringe should then be withheld for a few days. If large fruits are required, from four to six upon each plant must be the maximum number allowed. Melons require but little water until the fruits commence to swell. As soon as they are as large as a pigeon's egg, the plants must be fed with weak liquid-manure about twice a week, according to the weather. When the roots are visible upon the surface, a top-dressing of half an inch of cow-dung, and an inch of loam is required. The roots should be kept active that the foliage may last fresh as long as possible. Syringe freely in bright weather; the lecturer's experience was that this would keep the foliage clean and healthy, and not injure it. During dull cold weather syringe little, and instead, damp down all possible surfaces in the house to cause the necessary moisture. During January and February a night temperature of 55° to 60°, and a day temperature of 65° to 70° was sufficient. Both would be in-

creased as the season progressed. Air should also be increased in the same proportion, but draught avoided. In summer give air when the house reaches 75°, and allow it to rise afterwards to 80° or 90°, and shut up early with plenty of atmospheric moisture at a temperature of 95° or 100°. Later in the evening admit a little air at the top of the house. The fruits as they increased in size would require supports so constructed that the water might easily get away. When the fruits are ripening, sufficient water only to keep the plants from flagging should be given. When syringing has to be abandoned, Mr. Barkham has found that a solution of flowers-of-sulphur applied to the underside of the leaves was a capital prevention of red-spider. As a remedy for canker, some fresh-slaked lime applied to the affected spots was efficacious; powdered charcoal might be similarly used. A selection of varieties was then given by Mr. Barkham.

### SCOTTISH HORTICULTURAL ASSOCIATION.

MARCH 3.—The monthly meeting of the association was held in their rooms in St. Andrew Square, Edinburgh, on the above date, Mr. R. W. E. MURRAY, president, in the chair. The paper read was entitled "Notes on Floral Decoration," by the treasurer of the society, Mr. A. MACKENZIE. The subject was treated in an able manner, and the various styles of house and table decoration were reviewed, and the examples of arrangement shown, as well as a variety of plants employed.

Mr. MACKENZIE pointed out that the fashion and ideas of the day had to be studied by those who practised these floral arrangements, and that lightness and elegance were matters of much account. Several of the members took part in the discussion which followed the reading of the paper.

Some fine exhibits were placed upon the table, one of the more attractive being a new cross-bred *Dendrobium*, named *D. Broadhurstiana* = *D. nobile* × *D. Wardianum*, raised by Mr. CHALMERS, gr. at Tregless, Dumfries. The plant bore some large, well-coloured flowers, which seemed to possess more of the characteristics of *D. nobile* than of *D. Wardianum*. The lip was of large size, and of a dark colour.

Some creditable blooms, consisting of trusses of *Cattleya Lawrenceana* and *Dendrobium Dalhousieanum* came from Mr. ANGUS N. HALL, of Aberdeen, which were much admired for their luxuriance and fine colour.

Some fine trusses of bloom came from Messrs. R. B. LAIRD & SONS, of a distinct crossbred *Rhododendron*, the parents of which were *R. argentea* and *R. Falconeri*. The individual flowers are of large size and pure white, in immense trusses, well set off by the handsome foliage. Hardy flowering shrubs came from Mr. CHAPMAN, gr., Easter Duddingston Lodge.

### THE GARDENERS' ROYAL BENEVOLENT INSTITUTION IN DEVONSHIRE.

MARCH 4.—A meeting was held on Wednesday, in the Guildhall, Exeter, as was announced in our issue for February 29, p. 269, under the auspices of the Exeter Gardeners' Association, for the purpose of forming an auxiliary branch of the Gardeners' Royal Benevolent Institution in Devonshire. The Right Worshipful the MAYOR presided, in the unavoidable absence of C. R. COLLINS, Esq., J.P., President of the Devon and Exeter Gardeners' Association.

The Mayor was supported by the Sheriff of Exeter, the Rev. Dr. Dangar, Principal of the Training College, Exeter; Mr. H. J. Veitch of Chelsea, Mr. P. C. M. Veitch, Exeter; Mr. Samuel Jones, J.P.; Mr. G. J. Ingram, Secretary of the Gardeners' Benevolent Institution; Mr. G. D. Cann, Hon. Sec. of the Devon and Exeter Horticultural Society; Messrs. D. C. Powell, A. George, C. Berry, E. Sparks, and G. Lock, Lecturers on Horticulture under the Devon County Council; Mr. F. C. Smale, Hon. Sec. Gardeners' Association, Torquay; Messrs. W. Swan, Bystock, Exmouth; H. Seward, Creedy Park, Crediton; F. Hannaford, Hon. Sec. Teignmouth Gardeners' Association; J. H. Vallance, Hon. Sec. and Treasurer, Bristol and Bath Auxiliary of the Gardeners' Benevolent Institution; G. F. Vallance, Divisional Superintendent, London and South-Western Railway; Barnes, Winslade; J. McCormick, Wear House; W. Street, Newcourt; Abrams, Plamore; Slade, Poltimore; W. Rowland, Parkerswell; W. F. Meyer, S. Radley, and J. Baker, Exeter; Vickery, Streatham Ball; Turner, Oxtou; W. Bale, St. Elmo, Torquay; J. Laxton, Exeter Nurseries; and many others. Among the letters of apology were one from Lord Poltimore, saying he had just recently become a subscriber; one from Prebendary Bramley, of Uffculme, acknowledging the benefit received by two of his parishioners; and another from Mr. G. Baker, Membland, earnestly urging young gardeners to join the institution at once.

The MAYOR, in a few well-chosen remarks, said that he recognised in the local Gardeners' Association a Society which was doing good work in the city, and he therefore all the more readily bade them welcome to the Guildhall, in which, since their Society was formed, they had held their meetings. He referred in felicitous terms to the presence of Mr. Harry J. Veitch, a very old friend of the Mayor's. Having a prior engagement to dine with a public body elsewhere the same evening, he asked Mr. P. C. M. Veitch to take the chair on his leaving.

Mr. H. J. VEITCH, Hon. Treasurer of the Gardeners' Royal Benevolent Institution, reminding those present that if he was not standing on his native heath, he was, at least,

standing in his native city, made a powerful appeal for support to the Institution. He showed that it was not only the parent society of charitable organisations in the gardening world, but was cosmopolitan in the administration of its benevolence, was economically worked, and, in view of increasing claims upon its funds, not only proved the necessity for its continuance, but for its further extension. In Devonshire, he said, there were fifty-five subscribers, who contributed annually £57 15s. Against this there were eleven pensioners, who received annually £192. Altogether, £2,478 had been paid these eleven Devonshire pensioners, against an aggregate amount of £182 14s. received in subscriptions from them. Mr. Ingram followed, emphasizing the fact that the Institution was thoroughly national in character, and well entitled to the support of gardeners and horticulturists of every degree, and he hoped the meeting might be productive of increased interest and support from the county.

Mr. J. H. VALLANCE, of Bristol, gave an interesting account of the working of the Bristol and Bath Auxiliary, showing that, by combined effort, they had been able to do a great deal for the parent institution without its becoming a tax upon any one individually.

Mr. P. C. M. VEITCH, in proposing the formation of an auxiliary branch at Exeter, hoped that support worthy of the county would be given to the movement. He believed that if its objects and aims were better known to employers, there might be many among them who would be willing, as a reward for faithful service, to present their gardeners with a life-subscription to the funds of the institution.

Mr. WEEKS (gr. to G. A. Sanders, Esq., of Stoke House), in an interesting speech, seconded the motion, which was carried unanimously.

The Rev. DR. DANGAR (an enthusiastic amateur florist, and an expert on Carnations and bees) showed his entire sympathy with gardeners in the kindly way in which he referred to the vicissitudes of a gardener's calling.

Mr. W. MACKAY was elected honorary secretary and treasurer of the branch, and a committee representing all parts of the county of Devon was appointed to draw up rules and commence the work of the auxiliary. The committee is composed of the office-bearers of the Devon and Exeter Gardeners' Association, with the following added; Messrs. F. C. Smale and W. Bale, Torquay; Mr. T. Pender, South Devon Fruit Farm, Cockington; Messrs. F. Hannaford and G. Foster, Teignmouth; Mr. D. C. Powell, Starcross; Messrs. W. J. Godfrey and W. Swan, Exmouth; Mr. H. Berwick, Sidmouth; Messrs. H. Mairs and G. Lock, Crediton; Mr. R. J. Butt, Barnstaple; Mr. H. Soliman, Tiverton; Messrs. G. Baker and C. Cooper, Plymouth. Heartly votes of thanks were accorded to Messrs. H. J. Veitch, G. J. Ingram, and J. H. Vallance for their visit and help; to Mr. Andrew Hope for his assistance in organising the meeting; to Mr. P. C. M. Veitch for presiding, and to the Mayor for the use of the Guildhall. The outcome of the meeting is: three life-subscribers (10 guineas each), five annual subscribers (1 guinea each), and a number of promises to join the auxiliary branch. From the hearty, enthusiastic manner in which the matter has been taken up, and the healthy tone of the meeting, it is hoped that Devonshire may become a strong pillar of the Institution.

### UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MARCH 9.—The annual general meeting was held on Monday evening last at the Caledonian Hotel, under the chairmanship of Mr. J. Cheal. The report, as read by the secretary, was adopted amid general satisfaction, several of the members declaring it to be the most satisfactory yet made by the society. It was as follows:—

"The committee have again very much pleasure in presenting to the members the Annual Report and Balance Sheet for the year ending January 13, 1896, and in stating that the society continues in a prosperous condition.

Seventy members joined during the year, eighteen lapsed, and two died, leaving a net gain of fifty.

In the Benefit Fund, the amount of subscriptions paid was £296 14s. 7d., including arrears for 1894.

The Sick List has been rather a heavy one, the amount of £145 6s. 4d. having been paid to fifty members. The deductions from members' deposit account to meet this amount is 6s. 2d. and 4s. 2d. in the two scales of contributions respectively. The amount of sick pay has been increased since July 8 from 18s. to 18s., and from 10s. 6d. to 12s. per week in the two classes. Amounts standing to the credit of deceased members have been paid, also to one lapsed member.

Subscriptions to the Benevolent Fund from Benefit and Honorary Members is £128 9s. 6d. The sum of £7 10s. was granted to the widow of the late Charles Smith, and small sums amounting to £8 10s. 8d. were granted to other members in distress.

No call has been made on the Convalescent Fund during the year. Members' attention is particularly called to this fund, as its benefits might be considerably extended. Mr. Sherwood again gave £5 5s. at the annual dinner to this fund.

The Management Fund shows a balance of £30 8s. 8d. The Treasurer has invested £1100 during the year, in Corporation 3 per cent. Stock, and has a good balance in hand. The accounts have been carefully audited by Messrs. Gunner and Dixon, and found correct.

The committee, in conclusion, ask the members to do what they can to induce other gardeners to join this excellent society, as they are quite sure that no gardener can do better than join the "United."

The Annual Dinner was again carried out with spirit and

success. James H. Veitch, Esq., made an excellent chairman, and took the greatest interest in the proceedings.

To the above report was appended a detailed balance sheet, which we are unable to reproduce. It is a very satisfactory one, and may be had by application to the Secretary of the society.

A question having been asked in regard to the increase of the fees charged by the actuaries and auditors during the past year, the secretary explained that once every few years the accounts and position of the society had to undergo a thorough and detailed examination, incurring considerable additional work. During the last year this work had been done.

The Chairman congratulated the Society upon the satisfactory progress the Institution continued to make. There had been again a net increase of fifty members during the year, and the amount of invested funds was now £10,800. There was not any doubt but that the Society was skilfully and economically managed, and as an institution it was a perfectly safe one. Reference was made to a few of the earliest members who joined the Society, and the amounts now standing to their credit in the books were given. Gardeners could not do better than secure the privileges offered by the United Horticultural Benefit and Provident Society; and if by any chance a member lapsed, either through inability to keep up his payments, or through indifference, the sum standing to his credit was paid over when the member attained the age of seventy, or to his friends in the case of the member's decease earlier.

It was decided to print 3000 copies of the detailed report for distribution.

The election of officers next took place. Four members of the committee retire annually, but three of these were re-elected. The trustees, secretary, and other officers were re-elected, except in the instance of Mr. George, one of the trustees, who has reached the age of seventy, and is, therefore, no longer entitled to assistance from the Benefit Fund. It was felt by the meeting that under these circumstances it could not re-appoint Mr. George. A strong feeling of regret was evident, and a vote of thanks to the officer was unanimously passed. Mr. Scott (a member of the committee) was then elected a trustee, and Mr. Berry was elected a member of committee in the room of Mr. Scott. Votes of thanks to officers and the horticultural press followed.

### THE LONDON WHOLESALE FRUIT AND POTATO TRADES, AND GROWERS' BENEVOLENT.

MARCH 10.—The members of this association, with the above cumbrous title, met at the annual dinner, on this occasion held at the Holborn Restaurant on Tuesday, G. MONRO, Esq., in the chair. The muster of gentlemen connected with the wholesale fruit and potato trade of the metropolis was large, amongst them being Messrs. E. Coleman, Webber, Thomas, W. Bailey, Wadley, Jackson, Alderman Piper, G. Barham, Rochford, the Duke of Bedford's Covent Garden agent Mr. Assbee, &c.

The more serious business of eating and drinking being disposed of, various speakers rose to press the claims of the charity upon the attention of those present, and one or two toasts of the loyal character soon made way for the toast of the evening, "The London Wholesale Fruit and Potato Trades and Growers' Benevolent Society," which was proposed by the president in a few earnest telling sentences.

He pointed out how pressing the necessity for a charity of that kind which could afford a weekly sum sufficient to enable to exist in comfort, an old man or woman who through no fault had fallen on evil days in their old age. And he dilated on the duty of successful business men to assist to the best of their means the necessitous members of the trade, pointing his remarks by reciting the sad case of a former trader in Covent Garden Market, who had to take refuge in his old age in St. Martin's Workhouse. The fact of this broken-down trader being discovered in the "House" was indeed the original cause of the foundation of the Society. The membership now numbers 200 annual subscribers, 60 life subscribers, and 12 Vice-Presidents. The management costs but little, there are no offices to keep up, the proprietor of the Tavistock Hotel, Covent Garden, kindly affording the use of a room for meetings, &c., free of expense; and appeals made by Mr. Monro to persons outside the trade have met with excellent response, including amongst others, a handsome donation from the M.P. for the Strand Division the late Sir Julian Goldsmid, H. J. Veitch, and Messrs. Spiers & Poud.

Amongst the earlier endeavours of the society to raise funds may be mentioned a concert inaugurated by Mr. Lowe, which brought in a sum of £50; the gate-money at a club cricket match amounted to £18, and the same club seemed likely to contribute £100 this year. The society has £1000 invested in Consols now worth £1100; as the president said they must not be satisfied with the results of their efforts hitherto, but must redouble them, and especially tap sources of income outside their own sphere. The pensioners number at the present time three—one in 1895, and two this year, one candidate of more than eighty-one years old having to be rejected owing to lack of funds.

The total sum subscribed at the dinner amounted to the respectable sum of £317 16s., which goes far to show the wisdom of inviting a member of the trade to preside at the annual meeting.

**A NEW PATENT SPRAYER.**—We have received a new kind of sprayer, very useful to florists, gardeners, and those who cultivate plants in rooms. It is in the form of a small pair of bellows, and is fitted with an ingenious arrangement by which a continuous stream of fine spray is emitted. Either insecticides in liquid form, or clean water, can be used with it. The inventor is Mr. J. Sinclair, 18, Blake Street, York, and it is named the "Little Demon."

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

DISTRICTS.	TEMPERATURE.				RAINFALL.		BRIGHT SUN.
	ACCUMULATED.				10ths Inch.	Ins.	
	Above 42° for the week ending March 7.	Above 42° for the Week.	Below 42° for the Week.	Above 42° difference from Mean since Dec. 29, 1895.

The districts indicated by number in the first column are the following—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W. 9, Ireland, N.; 10, Ireland, S. \* Channel Islands.

**THE PAST WEEK.**

THE following summary record of the weather throughout the British Islands for the week ending March 7, is furnished from the Meteorological Office:—

"The weather was very unsettled in all parts of the kingdom. Rain fell almost daily, and about the middle of the period showers of snow, sleet, and hail were experienced. Thunder and lightning were very prevalent in the western, southern, and eastern districts on the 4th and 5th; while at night a brilliant display of aurora was observed in nearly all districts.

"The temperature just equalled the mean value in 'Scotland, N.,' but in all other districts it was above—the excess varying from 1° in 'Ireland, N.,' to 4° in the 'Midland Counties.' The highest of the maxima were recorded on the 1st in Scotland, but on the 6th or 7th over England and Ireland; they ranged from 60° in 'Ireland, S.,' to 55° in the 'Midland Counties' and 'England, S.,' and to 49° in 'Scotland, N.,' The lowest of the minima were registered either on the 4th or 5th, and varied from 25° in 'Scotland, N. and E.,' to 33° in 'England, S.,' and 'Ireland, S.,' and to 36° in the 'Channel Islands.'

"The rainfall exceeded the mean in all districts, the excess being very large in all except the north-eastern parts of the kingdom. Over southern and central England the fall was more than twice as much as the mean, in the Irish districts more than three times, while in 'England, N.W.,' it was four times as much as the normal.

"The bright sunshine exceeded the mean in the north-east of Great Britain, but was very little prevalent in the other parts of the kingdom. The percentage of the possible duration ranged from 39 in 'Scotland, E.,' and 32 in 'England, N.E.,' to 19 in 'Scotland, N.,' and 'England, S.,' and to 13 in 'Ireland, N.,"

**Obituary.**

**MR. GEORGE PRINCE.**—The Rev. David R. Williamson writes:—"It was with deep regret that I heard last Saturday of the death, on Tuesday, 3rd inst., of Mr. George Prince, of Oxford, one of my kindest and most valued friends. In a letter which I have received from his accomplished son, Mr. Ernest Prince, he tells me that his father 'passed peacefully away, without any pain.' He was an eminent horticulturist, and a most amiable man. As an exhibitor of Tea Roses, and especially of such superb varieties as Comtesse de Nadailac, which he made a specialty, his success was very great. The fine Rose, Souvenir de S. A. Prince, a sport from Souvenir d'un Ami, and named in memory of his wife, has proved an invaluable acquisition to Rose-growers. Clara Watson, raised by the late Mr. Henry Bennett, was popularised by him; and it has already proved, in virtue of its distinctive characteristics, a valuable addition to the class of llybrid Tea. I hope that the next Rose of special merit and attractiveness which his sons raise at Oxford may receive his honoured name."

[Mr. Prince made a specialty of the seedling Briar, and it was, as he often reminded us, owing to the notice given in these columns, with illustrations, that much of his subsequent success was due. Ed.]

**F. R. HORSMAN.**—We regret to have to announce the death from hæmorrhage, at the early age of twenty-four, of Mr. F. R. Horsman, who since his father's death on June 2, 1894, has ably conducted the business of Messrs. Fred. Horsman & Co., Orchid importers and growers, of Colchester. Although not of strong constitution, Mr. Horsman, like his father, kept to business up to the last; and for one so young, and who had to come into the business long before it was intended that he should, it may be said that he displayed great aptitude in the various matters necessary to carrying on such a business as that at Colchester successfully, and that he was greatly liked by all who had to do with him. The funeral took place on Saturday, March 7, in the presence of many friends, including representatives of the Orchid and nursery trade.

**MARKETS.**

**COVENT GARDEN, MARCH 12.**

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

**PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.**

	s. d. s. d.		s. d. s. d.
Adiantum, per doz.	4 0-12 0	Ficus elastica, each	1 0- 7 8

**OLD POTATOS.**  
There is no improvement since last report.  
**NEW POTATOS.**  
Arrivals have not been quite as heavy during the past week, and good supplies realise from 2s. to 3s. per cwt. advance. J. B. Thomas.

**SEEDS.**

**LONDON: March 11.**—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., describe to-day's market as poorly attended, with but a moderate business doing. For Clover and grass seeds there is a quiet demand at former cheap rates. Yearling American, as well as new French red Clover seed is being shipped to New York. For Cocksfoot, Timothy, Sainfoin, and Lucerne, last week's quotations are realised. Spring and winter Tares meet a fair sale. Rye is scarce and wanted. For Rape seed the tendency is upwards. Mustard shows no change. Blue Peas and Haricot Beans neglected. The Board of Trade returns give the imports of Clover and grass seeds into the United Kingdom for the first two months of this year as cwts. 109,428, value £217,044, as against cwts. 105,644, value £261,799 for the corresponding period of 1895.

**FRUITS AND VEGETABLES.**

**BOROUGH: March 10.**—Quotations:—Savoys, 4s. to 5s. per tally; Brussels Sprouts 2s. to 2s. 6d. per bushel; Carrots, 1s. 9d. to 2s. 3d.; and Turnips, 2s. to 2s. 6d. per dozen bunches; Onions, 3s. 6d. to 4s. 6d. per bag; Horseradish, 8s. to 12s. per dozen bundles; Apples, 4s. to 6s. per bushel.

**SPITALFIELDS, March 10.**—Quotations:—Sprouts, 1s. to 1s. 3d. per half-sieve; Kale, 9d. to 1s. per bushel; Seakale, 8d. to 9d. per bundle; Broccoli, 9d. to 1s. per bushel; Bunch Greens, 2s. to 3s. per dozen bunches; Rhubarb, 2s. to 2s. 6d. per dozen bundles; Turnips, 1s. 6d. to 2s. per dozen; Parsley, 1s. to 1s. 6d. per dozen bunches; Cauliflowers, 1s. 3d. to 1s. 6d. per dozen; Savoys, 2s. 6d. to 4s. per tally; Parsnips, 6d. to 8d. per score; Onions, 1s. 6d. to 2s. per doz. bunches; Turnips, 2s. to 3s. per ton; Carrots, household, 2s. to 30s. do.; horse do., 20s. to 24s. do.; Leeks, 1s. to 1s. 6d. per dozen; Horseradish, 1s. to 1s. 3d. per bundle.

**STRATFORD: March 10.**—The supply of green vegetables has been abundant, causing a drag in the sale; the other vegetables have met with a fair demand at the undermentioned prices:—Cabbages, 1s. to 1s. 6d. per bag; Savoys, 2s. 6d. to 4s. 6d. per bag; Greens, 1s. to 1s. 6d. per dozen; Cauliflowers, 1s. 6d. to 2s. per dozen; do., 5s. to 8s. per dozen; Scotch Kale, 4d. to 6d. per sieve; Beetroot, 4d. to 6d. per dozen; Horseradish, 1s. to 1s. 2d. per bundle; Parsley, 1s. per dozen bundles; Brussels Sprouts, 1s. to 1s. 3d. per half-sieve; Rhubarb, forced, 1s. 3d. per dozen bundles; white Turnips, 1s. 6d. to 1s. 9d. per bag; Leeks, 9d. to 1s. 6d. per dozen; Spring Onions, 2s. to 2s. 6d. per dozen; Salad, 1s. 6d. to 2s. per dozen; Carrots, household, 20s. to 28s. per ton; do., cattle-feeding, 20s. to 24s. do.; Parsnips, 4d. to 6d. per score; Mangels, 12s. to 13s. per ton; Swedes, 12s. 6d. to 18s. do.; Onions, Dutch, 2s. 6d. to 3s. per bag; Bordeaux sorts, 5s. to 6s. per case; Apples, English cookers, 3s. to 4s. 6d. per bushel; do., dessert, 3s. to 4s. 6d. per bushel; do., Nova Scotian, 12s. to 15s. per barrel.

**FARRINGTON: March 12.**—Quotations:—Cauliflowers, 1s. 6d. per dozen; Turnip-tops, 1s. per bushel; Sprouts, 1s. 3d. per half-bushel; Broccoli, 1s. per bushel; Leeks, 1s. per dozen; Turnips, 1s. 6d. per dozen bunches; Carrots, 2s. 6d. do.; Artichokes, 1s. per half-bushel; spring Onions, 2s. per dozen bunches; Rhubarb, 2s. per dozen bundles; do., forced, 1s.

per dozen; Horse-radish, 1s. per bundle; Calery, 2s per bundle; Kale, 6d. per bushel; Seakale, 1s. to 1s. 2d. per dozen; Radishes, 1s. per dozen bunches; Eadive, 1s. 6d. per dozen; Scarlet Beans, 3s. per basket; Cucumbers, 7s. to 8s. per dozen; Grapes, good black, 2s. 6d. per lb.; Apples, Nonpareils, 12s. to 16s.; Baldwins, 10s. to 14s. per barrel.

### POTATOS.

BOROUGH: March 10. — Quotations ranged between 35s. and 90s. per ton.

STRATFORD: Mar. 10. — Quotations:—Dark soil Bruce, 25s. to 30s.; do. light, 30s. to 50s.; Reading Giants, 40s. to 60s.; Sutton's Abundance, 40s. to 50s.; Scotch Main Crop, 63s. to 70s.; Dunbar Magnums, 70s. to 80s. per ton.

SPITALFIELDS, Mar. 10. — Quotations:—Black lands, Brucas, 3s. to 40s.; Reading Giants, 35s. to 40s.; High lands, Maie Crop Kidneys, 45s. to 60s.; Brucas, 40s. to 60s.; Giants, 45s. to 55s.; Hebrons, 50s. to 70s.; Scotch Main Crop, 45s. to 60s.; Brucas, 40s. to 50s.; Dunbar Main Crop, 70s. to 85s. per ton.

FARRINGTON: March 12. — Quotations:—Saxons, 70s. to 80s.; Ducbar Brucas, 60s. to 70s.; do. Maie Crop, 60s. to 80s.; Hebrons, 70s. to 80s.; Sutton's Abundance, 45s. to 65s.; Maie Crop, 40s. to 5s.; Imperators, 30s. to 35s.; Magooms, 30s. to 40s. per ton.

### HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 65s. to 87s. 6d.; inferior, 38s. to 60s.; hay, best, 60s. to 85s.; inferior, 30s. to 55s.; mixture, 60s. to 84s.; and straw, 20s. to 40s. per load.

## ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

Will some reader of the *Gardeners' Chronicle* kindly tell W. Davis if there is any kind of package or small basket that would be better or cheaper for the packing and marketing of Strawberries than the small 3 lb. crate which cost £1 per gross, and state where it can be obtained?

Will some reader of the *Gardeners' Chronicle* kindly state through these columns the address of Mr. Gasman, a cultivator of hardy European Alpine plants; also that of Sendtner and Stamm, whose names one sees so often attached to Alpine hybrids?

ACCOMMODATING A COLLECTION OF ORCHIDS WHERE THE HOUSE IS BEING PAINTED: A. C. As you do not possess another house into which the plants might be transferred, you must accommodate them in one half of the house, putting up some kind of partition of tarpaulin, wood, frigi domo, strong canvas, or strawed hurdles, and when the painting is done in the cleared half, transfer the plants to that division, and go on with the work. Of course, the warmth must be kept up.

ACER NEGUNDO FOLIIS VASIEGATIS: W. H. D., Pittsburg. The plant will be quite hardy in your latitude. It will stand 60° of cold without suffering.

AUGUSTE NICAISE STRAWBERRY: J. Geary. The plants are affected by so-called "blindness," and this disorder may be caused variously, such as by affording much water before the trusses are well above the leaves, exposure to frost after the flowers are in bud, or when expanded; and some varieties have a peculiar habit of going blind if early forced, although no evidence of it is remarked later in the year. The night-temperature is 5° too high for a start, and you ought to be careful to ventilate slightly by night, as well as more abundantly by day. Keep the plants well up to the glass; and if you can afford a mild bottom-heat—say, 75°—to the plants, taking them out of it when the flowers show generally, you will attain greater success.

BOOKS: J. J. G. *Orchid Growers' Manual*, by B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, N.—SOCIETIES AND GARDENERS' ADDRESSES: Rudolf Hertz. Purchase the *Horticultural Directory and Year Book for 1896*, price 1s., published at the office of the *Journal of Horticulture*, 171, Fleet Street, London, E.C.—G. R. & Co. *The Carnation*, by E. S. Dodwell, was published at I. Clement's Inn, Strand, W.C. It is possible, however, that the book may be out of print.

BOLBS INFESTED WITH INSECTS: Mite. The bulb you send (presumably a Vallota) has upon it some of the small transparent-looking insects known as the Eucharis-mite, which is not by any means peculiar to the bulbs of Eucharis. 2. There have been many opinions expressed as to the causes which lead to attacks from this mite. Some think that the mite (rather than being a first cause) follows decay or extreme weakness in the bulbs, resulting from a check to their growth, by unnatural cultivation, whether this be too low a temperature, too much water at the roots, or (by a series of forced growing and resting seasons) obtaining from the plants an excessive number of flowers. Mites will make no headway if the plants be kept growing strongly, for they enter only weak or partly-decayed bulbs. You might treat your Vallotas with a similar solution to that recommended on p. 177 for Eucharis bulbs, but make it rather weaker, and first cut away all decayed parts from the bulbs.

CARNATION: F. F. The plants are attacked by *Helminthosporium echinulatum*; and for remedy see our last issue, p. 306.

CATTLEYA TRIANÆI: A. T. The varieties of Cattleya Trianæi are very fine. No. 1 is the brightest we have seen this season, for the sepals and petals are so well coloured.

CULOGYNE LACTEA: W. J. W. It appears that the *Culogyne lactea* sent has been potted-up with the ordinary type, which it closely approaches in general appearance. No. 2 is *Dendrobium Pierardi*.

COSSAGEON.—Page 306, col. c, for in the Fuchsia, the calyx is absent read coloured.

DENDROBIUM WARDIANUM: J. W. A very excellent variety.

GLADIOLUS: C. W. The plants are not strong, and only the very best of them will flower this season. The Primula are not uncommon. Vine-leaf next week.

GREENHOUSE PLANTS: Amateur. Go to a nursery at this season, and make a selection on the spot of those species which please you, asking to be informed of those which are of easy culture. Do not omit bulbous plants which flower early, and creepers for the walls and rafters. Zonal Pelargoniums and Primulas should not be syringed overhead at this season. Adiantums should have a moist bottom to stand upon, and the potsides may be wetted, but not the fronds.

JAMAICA NEWSPAPER: C. L. *West Indian Field*, published at Kingston.

MALE FLOWERS ON CUCUMBER PLANTS: J. P. R. In winter, when the vitality of the plants is not high, it is prudent to pinch off the male blossoms after using the pollen; but at other seasons it is wasted labour. The syringe need not be used if a moist air can be maintained.

NAMES OF FRUITS: A. Wilson. Not known; fruit much bruised.—H. H. H. 1, Minchall Crab; 3, Golden Noble; 4, Rymer; 6, Scarlet Nonpareil; Pear, Benrre Rance. It is almost too late in the season to name fruits with certainty, for excepting the greatest care be taken, the skin gets so much bruised and discoloured as to be unrecognisable.

NAMES OF PLANTS: J. H. 2, *Auride odoratum*; 3, *Allium neapolitanum*; 4, *Polygala Dalmaisiensis*; 5, *Triteleia uniflora*; 7, *Senecio populifolius*, probably.—W. L. *Rhododendron arboreum roseum*.—J. C. *Lycaste candida*, the form of it known in gardens as *L. Lawrenceana*.—C. M., *France*, *Phalenopsis amabilis*, Blume, more commonly known in gardens as *P. grandiflora* and *P. Aphrodite* (*P. amabilis* of gardens). The other is *Ozontoglossum tripadiana*.—J. H. 1, *Polypodium punctatum*; 6, *Asplenium letum*.—Wm. W. *Ozontoglossum maculatum*, *O. odoratum*, *Laetrea decomposita*; *Maranta illustris*, the tall one; *Maranta picta*, the one with silver centre. In gardens, the Phryniams are generally called *Marantas*.—A. J. C. 1, *Ozontoglossum Egertonii*; it is generally known as "the lead from O. pulchellum," a definition which is probably correct. 2, *Dendrobium primulinum*; 3, *Ocoidium leucocibulum*.—J. C., *Selkirk*, 1 is a remarkably beautiful form of the plant known in gardens as *Ozontoglossum Ruckerianum*; 2 and 3 are unmistakably *O. Andersonianum*.—J. K. The best form of *Ocoidium obryzatum*.—*Horticulture Lidgoise*. Probably *Dendrobium × euosmum* (*Endocharis × nobile*).—*Hortus*, 1, *Erica carnea*; 2, *Erica*

*carnea alba*, commonly called *Erica herbacea* in gardens; 3, *Sempervivum tortuosum variegatum*; 4, *Sempervivum arachnoideum Laggeri*; 5, *Helleborus foetidus*; 6, *Rhododendron dauricum*.—H. S. 1, *Begonia Dregei*; 2, *Begonia incarnata*, called *B. metallica* in gardens; 3, *Begonia argyrostigma*; 4, *Lonicera tatarica*.—J. A. A good variety of *Dendrobium nobile*.—S. C. 1, *Blechnum occidentale*; 2, *Begonia subpeltata*; 3, *Begonia manicata*.—T. G. *Phaius grandiflora*.—J. A. 1, *Magnolia conspicua*; 2, *Rubus spectabilis*; 3, *Forsythia suspensa*; 4, *Kerria japonica*.

PINGS BUNGEANA: C. B. It is quite hardy in this country.

SECONDARY GROWTHS FROM THE PSEUDO BULBS OF DENDROBIUMS: C. R. D., *Newbury*. The production of growths at the joints of the pseudo-bulbs of newly-imported Dendrobiums is not liked by growers. The proper place for the new growths is the base of the old bulbs. In common sorts the growers often remove the growths proceeding from the joints of the pseudo-bulbs in order to favour the production of growth in the usual manner. In rare species or kinds desirable for propagation, they are encouraged, as it offers a ready means of multiplying the plant desired. We advise you to treat your plants as growing plants, without considering whether the growths are in the most desirable place or not. When the growths make leaves and roots, they can be removed from the lengths of the pseudo-bulbs and potted up to make extra plants.

TOMATO: A. F. Sutton's Earliest of All and Laxton's Open Air. Should the season be unusually warm, many other varieties will succeed outside.

TOMATOS: J. P. R. The "drooping" disease, for which there is no known cura. See *Gard. Chron.*, vol. xviii., p. 45.

TOMATOS AND CUCUMBERS: C. White. Without having seen specimens of diseased foliage and fruits, we are unable to give the malady a name, and can only suggest that you should employ the Bordeaux Mixture, a recipe for making which will be found in the *Gardeners' Chronicle*, July 1, 1893, p. 12. Can you not send specimens of both for our inspection? The Bordeaux Mixture, if the disease be not exceedingly prevalent on the plants, may save them; but if they are much weakened by the attack, it will be more prudent to burn the whole, and char the soil.

TROPEDEUM TUBEROSUM: *Nasturtium*. Plant in deeply-trenched soil at the foot of a warm wall, incorporating a considerable portion of sand with the staple, if it be stiff; and manure, in a decayed condition, if it be poor. Plant the tubers 6 inches deep.

WATER LILIES IN A STOVE: Mrs. A. Such "Water Lilies" as *Nelumbium speciosum*, white and rose, and very fragrant, and *N. luteum*; and the following species of Nymphaeas: *N. amazonum*, *N. ampla speciosa*, *N. stellata*, *N. s. cyanea*, *N. devoniensis*, *N. Lotus*. *N. zanzibarensis* will grow in a tank in the stove if sunshine can play on the surface of the water, and the latter is heated to about 75°. The seeds should be sown in small pots of loamy soil, or in flat baskets, the soil being weighted down by a layer of small stones, and sunk in the tank. The surface of the soil should not be more than 1 foot under water, and this would involve placing the baskets or pots on large inverted flower-pots or other contrivances, as the 3-foot deep tank is too deep. When the foliage decays, lower the warmth of the water, and let the plants remain till repotting time comes round in the spring; do not dry off the roots. Seeds and plants may be procured at some of the larger nurseries.

**W. COOPER, Ltd.,** HORTICULTURAL PROVIDERS, 755, OLD KENT ROAD, LONDON, S.E.

NATIVE GUANO.—BEST AND CHEAPEST MANURE FOR GARDEN USE. Price £3 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt.; 1 cwt. sample bag sent carriage paid to any station in England, on receipt of P. O. for 5s. Extracts from 20th Annual Collection of Reports:—

NATIVE GUANO FOR POTATOS, VEGETABLES, &c. R. LEE & SON, Market Gardeners, Burnham.—Used for three years for Vegetables, Strawberries, Cucumbers, Tomatos, and other Market Garden Crops, and it has "given great satisfaction for all crops." T. REASON, Gardener to Lord Windsor.—Used for several years for Potatos and general Kitchen Garden Crops. Results: "Good. A capital manure."

NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c. G. STONARD, Gardener to Sir A. T. Watson, Reigate.—"I have used your Guano for five years, and can bear testimony to its great value for fruit growing." C. ROUSE, Nazeing Park Gardens, Waltham Cross.—Used for Tomatos, Cucumbers, Chrysanthemums, and Roses. Results: "A marked improvement wherever used. A good and cheap manure."

Orders to the Native Guano Co., Ltd., 29, New Bridge Street, Blackfriars, London, where pamphlets of testimonials, &c., may be obtained. AGENTS WANTED.

THOMSON'S VINE AND PLANT MANURE.

The very best for all purposes. The result of many years' experience. Largely used both at home and abroad.

Agent for London:—J. GEORGE, 14, Redgrave Road, Putney, S.W. Agent for Channel Islands:—J. H. PARSONS, Market Place, Guernsey. Sole Makers:—WM. THOMSON AND SONS, LTD., Tweed Vineyard, Clovenfords, N.B.

Price Lists and Testimonials on application. Analysis sent with orders of 1/4-cwt. and upwards. SOLD BY ALL SEEDSMEN.

WEBB'S GARDEN FERTILISERS

Specially Prepared for all Crops. For VINES ... per bag of 28 lb. 6/- For POTATOS ... ditto 5/- For TOMATOS ... ditto 6/- For CHRYSANTHEMUMS ... ditto 7/6 For LAWNS ... ditto 6/-

WEBB'S COMPOUND MANURE. The Best General Manure for Vegetables and Flowers. 1 lb., 1s.; 3 lb., 2s. 6d.; 7 lb., 5s.; 28 lb., 13s.

Reduced Rates for large quantities on application. OUR MANURE WORKS at SALINITY, CHESTER, ARE 5 ACRES IN EXTENT.

WEBB & SONS, The Queen's Seedsmen, Wordsley, Stourbridge.

FOWLER'S LAWN SAND.—For destroying Daisies and other Weeds on Lawns, &c., at the same time acting as a fertiliser, and improving the growth and colour of the grass. Price in tins, 1s., 2s. 6d., and 5s.; kegs 8s. 6d., 16s., and 30s. Sold by all Seedsmen. CORRY AND CO., Ltd., London, F.C.

XL ALL LIQUID INSECTICIDE, (PATENT),

For Syringing, Dipping, and Washing Plants and Fruit Trees. Manufactured in Bond, from pure Nicotine of Tobacco, by special permission of the Hon. Board of H.M. Customs.

ADVANTAGES CLAIMED—It is always of uniform strength, and perfectly safe when used as directed. Kills every insect which affect Plants and Fruit Trees. Does not stain Foliage, Flowers, or Fruit. A clear Liquid (no sediment), herein differing from the crude, thick, soapy preparations frequently recommended. Being the Strongest in the Market, it is cheap in use, standing twice the amount of dilution of any other safe preparation. As an example, Kills Fly at 1 to 40 parts of water.

1 Pint, 2s.; 1 Quart, 3s. 6d.; 1/2-Gallon, 5s.; 1 Gallon, 10s.; also in 4 and 6-Gallon Drums.

To be had from all Nurserymen, Seedsmen, and Sundriesmen or direct from the Manufacturer and Patentee— G. H. RICHARDS, Old Shot Tower Wharf, Lambeth, London, S.E. Telegraphic Address—"Vaporizing, London."

BEESON'S MANURE, SHEFFIELD.—For Vines, Plants, and Vegetables. Sold with a Guaranteed Analysis. Has stood the test of the principal growers for over 20 years, and is admitted to be the Best for all Horticultural Purposes. In boxes, 1s. and 2s. 6d.; bgs, 50 lb., 8s.; 1 cwt., 15s. May be obtained through any Seedsmen; or, direct (bags only), carriage paid, and liberal discount for cash with trial order, from W. H. BEESON, SHEFFIELD. Pure Crushed Bones, all sizes, and other Fertilisers at market prices.

HEAD GARDENERS AND NURSERYMEN who use BONES, should apply for price and particulars to E. S. WILES AND LEWIS, Bone Works, St. Albans.

STANDEN'S MANURE.

ESTABLISHED OVER 30 YEARS. Exceeds all others in General Fertilising Properties and Staying Powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell. The highly-fertilising properties of this Manure render its money value, in comparison with other Manures, at least double; and users will find that very small quantities will produce favourable and lasting results.

THE ANALYSIS SHOWS— Insoluble Phosphate ... 35.74 per cent. Soluble ... " " " " " 83 " Nitrogen ... " " " " " 8.93 " (Equal to Ammonia) ... " " " " " 10.85 " Sold in Tins, 1s., 2s. 6d., 5s. 6d., and 8s. each; and in Kegs, well secured, to prevent loss through exposure, 28 lb., 10s. 6d.; 56 lb., 18s.; 112 lb., 32s.

To be had from Seedsmen and Florists. MANUFACTURERS—

CORRY & CO., Ltd., LONDON.

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 18 ounces as a winter dressing for Vines and Orchard-house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., with the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

KILL-M-RIGHT

Certain cure for Blight, and all Insect Pests, without injury to plants. Once tried, always used. Sample Tin, 2 lb., free by Post, on receipt of P.O. for 2s. 10d. Price LIST and testimonials on application.

The STOTT FERTILISER & INSECTICIDE CO., BARTON HOUSE, MANCHESTER.

#### GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary rate.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

### SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. A. STRATTON.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

# SHANKS'S LAWN MOWERS

THE ONLY ONES FITTED WITH PATENT AXLE SPRINGS.

ALL STRAIN REMOVED, EVEN ON ROUGH GROUND. GREAT EASE IN WORKING AN ADVANTAGE BOTH TO MACHINE AND USER.

STANDARD HAND GEAR MACHINE, WITH PATENT AXLE SPRINGS.

IN USE AT LORDS, THE OVAL, CRYSTAL PALACE, The Principal Parks in London, and in the Chief Cricket, Tennis, and Polo-Grounds throughout the Kingdom.

STANDARD HAND CHAIN MACHINE, WITH PATENT AXLE SPRINGS.

## TESTIMONIALS.

LORDS CRICKET GROUND, LONDON, June 15, 1894.

I have used your Lawn Mowers for over twenty years, and have no fault to find with them. I consider them the best in the market, and they are the only Machines we use here. The addition of the springs to our 48-in Mower is a great improvement, and the machine works with great ease and smoothness. I consider you have made a good hit.—Yours truly, (Signed) PERCY PEARCE, Ground Superintendent.

SURREY COUNTY CRICKET CLUB, KENNINGTON OVAL, LONDON, April 3, 1894.

I have given our large machine that you fitted with your Patent Springs a fair trial. I am very pleased indeed with the springs; they do away with all jar and shake on any ground, and prove to be all you claim for them.—Yours truly, (Signed) SAMUEL APTED.

(PER BEN REID AND CO., OF ABERDEEN.)

The "CALEDONIA" Lawn Mower made by Shanks, Arbroath, is one of the best I have ever tried. I got a 14-inch size, and it is undoubtedly the lightest and sweetest-working Mower in my collection.

(Signed) JOHN M. TROUP, Gardener to H.M. the Queen, Balmoral.

## SMALL HAND MACHINE,

6-IN., 7-IN., AND 8-IN. SIZES.

VERY SUITABLE FOR LADIES' USE AND MOWING VERGES.

## TESTIMONIALS.

DALHOUSIE GOLF CLUB, CARNOUSTIE, October 8, 1895.

I am pleased to inform you that the Horse Lawn Mower recently supplied to the Dalhousie Golf Club, and used on Carnoustie Golf Course, is giving very great satisfaction. The Springs are a great improvement on the old style, not only enabling the Machine to get at the grass on undulating ground, but in the relief to the man guiding it. I need hardly add that we are now getting our grass very much better cut than we did with a Machine without the Springs. (Signed) D. MCINTYRE, Hon. Secretary.

HURLINGHAM CLUB, FULHAM, June 13, 1895.

I have used your Lawn Mowers for over twenty years, and find them the best. The addition of Springs is a very great improvement. (Signed)

WM. SUTHERLAND, Head Gardener.

RANELAGH CLUB, BARNFS. S.W., October 13, 1895.

On behalf of the Committee, I have pleasure in stating that your Mowing Machines fitted with Patent Steel Springs have been used for six months on our Golf Links and Polo-Grounds, and have given the greatest satisfaction. The Springs, in our opinion, are a great improvement in Lawn Mowers.—Yours faithfully, (Signed) HENRY E. RIDLEY, Assistant-Secretary.

"THE BRITANNIA," Perfect Side-Wheel Machine.

"THE CALEDONIA," Light Roller Mower. WITH AXLE SPRINGS.

ALL SIZES IN STOCK.

REPAIRS EXECUTED, BOTH AT THE WORKS and in LONDON.

HORSE & PONY MACHINES } The Best in the Market. (For particulars, see Advertisement in this Paper for Feb. 29.)

Special Mowers for Golf Courses. Rollers for Horse, Pony, & Hand Use.

ILLUSTRATED CATALOGUE on Application. OF ALL IRONMONGERS, SEEDSMEN, &c.

ALEX. SHANKS & SON, LTD., ARBROATH; & 110, CANNON ST., LONDON.

VALUABLE IMPORTED ORCHIDS.

A fine Importation of CYPRIPEDIUM VILLOSUM, from an entirely new district; C. CHARLESWORTHII, DENDROBIUM FORMOSUM GIGANTEUM, CYPRIPEDIUM SPICERIANUM, DENDROBIUM THYRSIFLORUM, &c., just received in splendid condition. Also, by order of Messrs. W. L. Lewis and Co., a grand importation of

CATTLEYA WARNERI,

in magnificent order; LELIA TENEBROSA, CATTLEYA INTERMEDIA, &c.; ODONTOGLOSSUM HASTIABUM, &c.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on THURSDAY NEXT, March 26.

On view morning of Sale, and Catalogues had.

**Thursday Next.**

AN IMPORTATION OF

**CATTLEYA SPECIES,**

Just received direct, in ten cases, from Pernambuco, Brazil, in splendid order. Without Reserve.

MR. J. C. STEVENS will include the above in his SALE by AUCTION at his Great Rooms, 38, King Street, Covent Garden, on THURSDAY NEXT, March 26. On view morning of Sale, and Catalogues had.

**Monday Next.**

AZALEA MOLLIS, A. INDICA, CAMELLIAS, and other Greenhouse PLANTS, 50 lots of Stova and Greenhouse FERNS, 400 Standard and Dwarf ROSES, PEONIES, SPIRÆA, BEGONIAS, GLADIOLI, LILY OF THE VALLEY CROWNS, &c.

MESSRS. PROTHEROE AND MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on MONDAY NEXT, March 23, at 12 o'clock.

On view morning of Sale, and Catalogues had.

**Tuesday Next, March 24.**

By order of Mr. P. McArthur, The London Nurseries, Maida Vale.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, March 24, at half-past 12 o'clock.

A MARVELLOUS IMPORTATION OF

CATTLEYA MOSSIE, from a new district; some remarkable varieties have opened in the cases (Cattleya Wagneri was found growing with them, and these will be offered for sale at an early date).

CATTLEYA LABIATA PERCIVALIANA AUTUMNALIS (TRUE).—Flowers in December; quite distinct from the ordinary type. Flowers are larger, and more richly coloured.

A NEW GIGANTIC CATTLEYA, provisionally named "GLUCKIANA."—This flower in February. It was found on cool high mountains at an altitude of 2000 feet; its enormous flowers are 8 inches across, bright pink, after four or five days it becomes bluish-cerulea, and remains in perfection three weeks. Every plant was collected. Dried flowers will be exhibited at the Sale.

LELIA GORTONI, new, very wonderful. The Collector says it is very lovely. It flowers at Christmas; the colour is cerulea blue. Only a few plants were found.

A Marvellous Importation of ANGULO RUCKERII SUPERBA (TRUE, GUARANTEED).—This true variety is most difficult to obtain. Every plant was secured. It gives us great pleasure in being able to offer this unique variety.

ODONTOGLOSSUM SCHILLERIANUM, RAMOSISSIMUM LILIFLORUM, LYCASTE SCHILLERIANA, ANGULO, MAXILLARIA LUTEA-FLORE, a new variety, yellow and white; ODONTOGLOSSUM STELLIMICANS, with many other valuable imported plants.

On view morning of Sale, and Catalogues had.

**WEDNESDAY NEXT.**

**Friday Next, March 27.**

Great Sale of ORCHIDS, by Order of F. Sander & Co., St. Albans.

Splendid selections of CYPRIPEDIUMS and DENDROBIUMS, including a magnificent consignment of CYPRIPEDIUM INSIGNE MONTANUM, Sanderæ section, collected from the district which originally yielded C. i. Sanderæ. From the distinct appearance of the plants, many varieties are anticipated.

MILTONIA SPECTABILIS, var. MORELIANA.—The dark large-flowered atro-rubens type.

A consignment of CYPRIPEDIUMS sent by the Collector, as, CYPRIPEDIUM INSIGNE PUNCTATUM VIOLACEUM.—This magnificent variety has not been imported for twenty years, and among the plants offered, C. I. MAULEI may be looked for.

CYPRIPEDIUM CURTISII.—A noble, richly-coloured, and very desirable species.

A CYPRIPEDIUM species obtained from the Dokela district, and which our Collector thinks is new, or else a peculiar form of C. superbiens.

DENDROBIUM BENSONLE.—Plants in grandest order.

COELOGYNE OCELLATA, MAXIMA.—A beautiful, easily-grown, snow-white and yellow-flowered Orchid, most floriferous, deliciously scented, and very valuable for all kinds of floral decoration.

1000 Plants of VANDA CERULEA, gathered from the district which has yielded the finest varieties of all.

A splendid consignment of over 1000 plants of DENDROBIUM INFUNDIBULUM. The plants are in grand order, and we strongly recommend this opportunity of acquiring this magnificent species. The huge white and golden-yellow blossoms always command admiration, and are most serviceable for decoration. Also

THUNIA BENSONLE, DENDROBIUM CRASSINODE, D. ALBO-SANGUINEUM, D. DALHOUSIENUM, D. AUREUM, D. DIXANTHUM, D. DENSIFLORUM, ONCIDIUM VARICOSUM ROGERSHI, CYPRIPEDIUM PARISII, &c., to be sold by

MESSRS. PROTHEROE AND MORRIS at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, March 27, at Half-past 12 o'clock.

On view morning of Sale, and Catalogues had.

**Friday Next, March 27.**

"REICHENBACHIA."—The great work on Orchids, illustrated and described by F. SANDER, E.-q., magnificently illustrated in colours, neatly bound. Second Series, Vols. I and II.

"THE ORCHIDACEÆ OF MEXICO and GUATEMALA," by JAMES BATEMAN, Esq.

MESSRS. PROTHEROE AND MORRIS will include the above BOOKS in their ORCHID SALE on FRIDAY NEXT, March 27, at 2 o'clock.

**ON TUESDAY NEXT, MARCH 24.**

- LARCH, Weeping, Pyramids, 5 to 10 feet.

KNAP HILL NURSERY, WOKING, SURREY.

# WHEELER'S ALDERMAN POTATO.

For exhibition this Potato is a model, the eyes are shallow, the skin rough; it is of large size, a great cropper, and of the finest possible quality; it withstands disease well, and is one of the most profitable Potatoes to grow. The tubers will stand cutting freely.

Price 3s. per peck; 10s. 6d. per bushel (56 lb.).

In order to extend the knowledge of this valuable Potato, we will forward a sample of 2 lb. post free on receipt of one shilling.

I cannot speak too highly of your ALDERMAN POTATO. I had plenty of tubers 1 1/2 lb. in weight, and they cooked very dry and white.—W. H. FREETH.

Your ALDERMAN POTATOS were very good indeed. I weighed one of the largest, and it turned the scale at 2 lb. 3 oz. I never had such Potatos before.—HY. MORGAN.

Your ALDERMAN POTATO is a splendid one.—MAJOR C. BROWNE.

Last year's produce of the ALDERMAN POTATO was excellent. We are eating them now every day, and often remark their goodness.—H. W. LIVETT.

I am especially pleased with the ALDERMAN POTATO, and consider it one of the most valuable introductions.—J. H. FRY.

From 7 lb. of your ALDERMAN POTATOS I raised 3 cwt.; for size and cooking quality nothing can surpass them; many weighed 1 1/2 lb. each, and one extra large one being 2 lb. 2 oz.—JOHN CLUTTERBUCK.

Numerous other testimonials, copy of which may be had gratis and post free on application.

74, Wigmore Street, W. 12, Melbourne Place.

**LETHORION (Vapour Cone) PATENT.**

The total destruction of Insect Pests in Greenhouses is thoroughly secured without the slightest possible injury to Flowers or Plants of the tenderest kind. IT CANNOT fail where the houses are secure. Red Spider, Scale, and Mealy Bug can be easily eradicated by doubling the Cone power.

PRICES: For frames, &c., of 50 to 100 ft., 6d.; 500 to 700 ft., 9d.; 1,000 to 1,500 ft., 1s.; 4,000 ft., 3s. 6d.

The public are cautioned against imitations in various forms at less cost, as they have in most instances proved to be worthless articles, totally unequal to Lethorion in strength and effect.

OUR MANURE WORKS at SALTNEY, CHESTER, ARE 5 ACRES IN EXTENT.

**WEBB & SONS,**  
The Queen's Seedsmen, Wordsley, Stourbridge.

**NATIVE GUANO.—BEST AND CHEAPEST MANURE FOR GARDEN USE.** Price £3 10s. per ton, in bags. Lots under 10 cwt., 4s. per cwt.; 1 cwt. sample bag sent carriage paid to any station in England, on receipt of P. O. for 5s. Extracts from 20th Annual Collection of Reports:—

**NATIVE GUANO FOR POTATOS, VEGETABLES, &c.**  
**B. LEE & SON, Market Gardeners, Burnham:—**Used for three years for Vegetables, Strawberries, Cucumbers, Tomatoes, and other Market Garden Crops, and it has "given great satisfaction for all crops." **T. KEASON, Gardener to Lord Windsor:—**Used for several years for Potatos and general Kitchen Garden Crops. Results: "Good. A capital manure."

**NATIVE GUANO FOR FRUIT, ROSES, TOMATOS, &c.**  
**G. STONARD, Ordener to Sir A. T. Watson, Reigate:—**"I have used your Guano for five years, and can bear testimony to its great value for fruit growing." **C. ROUSE, Nazeing Park Garden, Waltham Cross:—**Used for Tomatos, Cucumbers, Chrysanthemums, and Roses. Results: "A marked improvement wherever used. A good and cheap manure."

Orders to the **Native Guano Co., Ltd., 29, New Bridge Street, Blackfriars, London.** where pamphlets of testimonials, &c., may be obtained. **AGENTS WANTED.**

**BEESON'S MANURE, SHEFFIELD.—**For Vines, Plants, and Vegetables. Sold with a Guaranteed Analysis. Has stood the test of the principal growers for over 20 years, and is admitted to be the Best for all Horticultural Purposes. In boxes, 1s. and 2s. 6d.; bags, 50 lb., 8s.; 1 cwt., 15s. May be obtained through any Seedsmen; or, direct (bags only), carriage paid, and liberal discount for cash with trial order, from **W. H. BEESON, SHEFFIELD.** Pure Crushed Bones, all sizes, and other Fertilisers at market prices.

**XL ALL LIQUID INSECTICIDE, (PATENT),**  
For Syringing, Dipping, and Washing Plants and Fruit Trees.

Manufactured in Bond, from pure Nicotine of Tobacco, by special permission of the Hon. Board of H.M. Customs.

**ADVANTAGES CLAIMED—**  
It is always of uniform strength, and perfectly safe when used as directed. Kills every insect which affect Plants and Fruit Trees. Does not stain Foliage, Flowers, or Fruit. A clear Liquid (no sediment), herein differing from the crude, thick, soupy preparations frequently recommended. Being the Strongest in the Market, it is cheap in use, standing twice the amount of dilution of any other safe preparation. As an example, Kills Fly at 1 to 40 parts of water.

1 Pint, 2s.; 1 Quart, 3s. 6d.; ½-Gallon, 5s.; 1 Gallon, 10s.; also in 4 and 6-Gallon Drums.

To be had from all Nurserymen, Seedsmen, and Sundriesmen or direct from the Manufacturer and Patentee—

## THE Gardeners' Chronicle.

SATURDAY, MARCH 21, 1896.

### ROSE-GROWING AND PRUNING.

THE perplexities of a man who consults a book of domestic medicine in order to find out what malady he is suffering from, are humorously described by Jerome in *Three Men in a Boat*, when one of the party, being out of sorts, consults his Buchan or Thomson, and comes to the conclusion that he has got every complaint that it is possible for any one to have, with the exception of a housemaid's knee, and thinks it rather hard he cannot trace any symptoms of that. Now, I am not at all sure but that the same perplexity must be present to the mind of any one who consults the various gardening periodicals for information or advice on any particular subject. Take, for example, the plain matter-of-fact one of pruning Roses. So much has been written upon it, so many wise people have put their heads together to give advice, that one would think there was no room left for any doubt upon the subject—and yet very diverse are the opinions. Thus, for example, the subject of pruning the white Bath Moss Rose, has been brought forward lately; one paper says it ought to be left alone, while another writer states that it ought to be hard pruned—and both claim to have succeeded on these very opposite practices. It may, therefore, be as well, now that the time of year is at hand for the operation of pruning to be performed, to say how it can best be done. The very first question which presents itself is that of time; when is it to be done? The answer to this cannot be given absolutely, for so much depends on locality. Roses in the south and west are always much more forward than those in the midlands and north, and therefore a hard-and-fast line cannot be drawn. During the very mild weather in the early part of February, when Roses were putting forth shoots at their extremities, growers began to sharpen their pruning-knives, and to think the time had come for them to begin. Then came the sharpest bit of cold we have had this winter, and rosarians began to be thankful that they had let their plants alone. Frequently the freshness of the foliage leads growers to imagine that all this vigour must be injurious to the future development of good flowers, or that it must take away some of the strength which would otherwise be given to blooms. My own somewhat lengthened observation does not lead me to this conclusion, for I do not find, as far as I can judge, that the plants suffer in any way. Of course, if the buds pushed from the bottom, the case would be very different; but it is only the buds at the end of the shoots which move.

When most people talk or write about pruning, they refer, tacitly at least, to the classes of Hybrid Perpetuals and Teas or Noisettes; and summer-blooming Roses are altogether outside their calculations. This is natural enough, for they hardly

**JAMES VEITCH & SONS**  
ROYAL SEED ESTABLISHMENT,  
**CHELSEA, LONDON, S.W.1**

require any pruning at all; still, as we have seen in the case of the Moss Rose, there is a wide difference of opinion. Another point, which is not always taken into consideration, and about which varying conflicting opinions are held, is, what is to be done with newly-planted Roses? when are they to be pruned? Some say early, and some late. My own opinion inclines to the latter, and that it is better for them to get a good hold of the ground before the knife is applied. If I pruned my established plants in March, I should leave the newly-planted ones for another month, that is, if I were able to superintend the pruning. You put an ordinary gardener to prune your Roses; you give him all sorts of directions, but he either cannot or will not understand them, and applies the same pruning to all alike. Now this is a very fatal mistake, which will have to be paid for by-and-by. There are many Roses which have their peculiarities in different soils and situations; with myself this is exemplified in the case of Etienne Levet, one of the most vigorous growers in cultivation, but with me this variety is never very vigorous—why, I cannot say, but the fact remains, and were I not to prune it like moderate-growing ones, I should get no blooms at all. As a general rule, then, the end of March is about the best time for pruning. In the warmer districts the middle of the month will probably be considered the most suitable time, while in the north a fortnight later will probably be considered best. I am, of course, now alluding to what we call exhibition Roses, for I maintain that whether a grower is an exhibitor or not, the methods adopted to ensure good blooms for the exhibition-table will be those most suitable for the decoration of the garden. As I have said, the same pruning is not adapted for all varieties: the very vigorous growers will, if pruned hard, push forth a forest of shoots, but with buds disappointing in character; while the weaker growers should be pruned as hard as possible, leaving only two or three eyes at the base, for what is required is to concentrate the power, and so give the weakly-constitution plant less to do. As I always thin out my Roses in the autumn, so as to admit more air and light in the winter, and so to give more chance of the wood being ripened, there is less to be done now at this busy time. The cutting back of the shoots is a great point to be attended to. Although it is hardly possible in the present system to get what is called a handsome bush, yet this may be done with some varieties, care being taken that the top bud left on the shoot should point outwards.

I do not think that there is very great difference to be made in the pruning of Teas, except that it should not be done quite so early. There are amongst them strong growers, such as Marie Van Houtte and Madame Lambert; there are also weakly growers like Comtesse de Nadailac, and I think that as in the case of hybrid perpetuals the former should be pruned moderately, and the latter severely. The proper place for Noisettes, or those Teas which have a Noisette character about them, is a wall or fence, or failing these, a pillar; whatever pruning these require is done in the autumn. Such kinds as Gloire de Dijon and its allies, Réve d'Or, W. A. Richardson, &c., will then only require to have tips slightly shortened, and old and useless wood cut out, so as to give place to the young spring growth to be brought in. I have been surprised to find how well some of these do succeed on a wall facing the east.

With regard to the summer Roses, including Provence, Moss, &c., the plan recommended by that prince of Rose growers, the late Mr. Thomas Rivers (to whose book, *The Rose Amateur's Guide*, one naturally turns, notwithstanding all that has been written since), is to prune hard in October, leaving some of the shoots to be pruned in May—but I do not think this is the plan now generally adopted; the plants are left more to themselves, for it is found that hard pruning tends to luxuriant growth at the expense of blooming.

Nothing can be more beautiful for the ornamentation of the garden than the copper and yellow Austrian Briars. They require but little of the knife; the stronger shoots may be shortened a little, but on the whole, they are better left alone. It is

difficult to get them into shape as a bush, and after all, as they are so free-flowering, they are best left to form themselves naturally; the same may be said of the beautiful new race of hybrid Sweet Briars raised by Lord Pezance. They are very strong in their habit of growth, and are admirable for a fence or hedge, where there is space for them. In the same way the single Roses should be left to themselves where that is possible. Any one who has seen *Polyantha simplex* at Mr. Girdlestone's, of Sunningdale, where it has been absolutely left alone, will not easily forget the sight. The same may be said of *Macrantha*, Paul's Single White, and Crimson Pillar, which ought to have room in every garden where they can be accommodated, and some of these, although only summer, and, therefore, only once-blooming Roses, will occasionally give blooms in the autumn months.

These may seem to many commonplace and trite remarks, and so, no doubt, they will appear to the experienced Rose-grower; but there are numbers of persons who are not experienced, and who are always anxious to obtain information. I do not pretend to be a great authority, and my notions may seem to some antiquated, but if I err, I err in good company. *Wild Rose*.

## NEW OR NOTEWORTHY PLANTS.

### ODONTOGLOSSUM ANDERSONIANUM, *Kitsoni*, n. var.

In breadth of petal, form of the flower, distinctness of the spotting, and all the other points which gardeners admire, this is the best form of *O. Andersonianum* which I have seen, its flowers, though smaller, having the form of those of one of the best *O. crispum*, although the cream-white ground-colour of the flower, the form of the lip, and especially its odour, proclaim it to be a true *O. Andersonianum*. The sepals and petals are formed alike, and each is nearly three-quarters of an inch in width, and the lip, which is shorter than usual, has a similar width at the upper part. The flowers are creamy-white, with a purple tinge running up the middle of the sepals, which bear several large reddish-brown blotches, the petals having more but smaller spots of the same tint; and the lip, which is yellow at the base, has one large blotch in the centre. It was imported and flowered by J. H. Kitson, Esq., Elmet Hall, Leeds (gr., Mr. Thos. Bonsall). *J. O'Brien*.

### THE DOUBLE WHITE-FLOWERED CAMELLIA.

NEGLECTED as the Camellia is in these days, there is no plant which can compare with it for the conservatory as a winter bloomer. At the Royal Nursery, Slough, there are to be seen some fine plants in pots in the very pink of condition, blooming abundantly. There is an effectiveness in the massive, finely-formed, double blossoms of the white Camellia *fimbriata alba*, but this does not preserve it from fashion's verdict of being too formal, an untenable objection—there being many favourites equally regular in build. Thackeray characterised the Camellia as being his ideal button-hole flower, which it was in those days; since then Orchids, Roses, and Carnations have come into competition with it, and it has gone under in popular estimation. At Dropmore Mr. C. Herrin has some massive specimens that may be said to be covered with blossoms, of which he can cut numbers. In times past gardeners grudged the sacrifice of so much wood and foliage in cutting a flower, mainly because the shoot from which the point was cut was not likely to again produce a bud for the space of two years. But since the simple process of wiring has been introduced, the flower having a fitting calyx for this purpose, it has been found that a cut Camellia blossom will last good for nearly or quite so long a period as when cut with a portion of the shoot and leaves. Seeing the long succession of bloom extends over a considerable period, is another reason for again taking the plant into favour. Another peculiarity about the Camellia

is, that large plants will flourish and make magnificent heads when grown in smallish pots, if good drainage and feeding be provided. The fine and commanding specimens at the Royal Nursery, Slough, are in pots so small as to lead to the supposition that their roots are nudely restricted, but the amplitude of the foliage belies such a supposition. *R. D.*

## ORCHID NOTES AND GLEANINGS.

### ORCHIDS AT TAPTON COURT.

THE collection of Orchids belonging to Henry Steel, Esq., of Tapton Court, Sheffield, is at the present time very well worth a visit from admirers of these plants, the *Dendrobiums* alone forming a grand sight. *D. Wardianum* is well represented, the plants excellent, and the pseudo-bulbs of good length and substance, some of them possessing forty-five flowers, and 130 flowers on a plant. *Dendrobium Wardianum album* was a variety that was noted in flower. *D. nobile* var. *nobiliss* is a well-grown example, with 130 flowers, and *D. v. var. Sanderianum*, *D. n. Schroderianum*, and *D. n. Wallichianum* are plants which have a large number of blooms open on each. Amongst cross-bred *Dendrobiums* I observed a fine plant of *D. Ainsworthi* var. *roseum* with ninety-six flowers; and well-flowered plants of *Ainsworthi melanoticus Victorianis*, Rolfe. Among other choice crosses in bloom were the rare and very scarce hybrid, *Aspasia*, Venn, and the valuable *Amesiae*.

Cattleyas are largely grown, and among those in flower are some very fine varieties of *C. Trianaei*, including a fine healthy plant of *Trianaei alba*. *Cypripediums* are well grown, and there were remarked in flower plants of *C. villosum*, *C. selligerum majus*, *C. Lathamianum*, *C. Leeann superbum*, *C. Calypso*, and *C. Gowerianum*.

*Odontoglossums* form an extensive collection, and one large house is devoted to their culture. These plants are in the best of health and showing numerous flower-spikes; and among those in bloom is a splendid variety of *O. crispum*, and some fine hybrids. *Ceologyne cristata alba* is a species of which there are numerous examples—twenty-three pans, some in flower, were counted, the plants being in fine condition and scarcely to be excelled in the country. The other departments of the gardens at Tapton are in capital order, and considering the local disadvantages, much credit is due to the gardener, Mr. Howarth for the excellent results achieved. *H. H.*

### PLATYCLINIS OLIVACEA.

A noble specimen of this graceful white-flowered and fragrant Orchid, with about 240 flower-spikes, may soon be seen in full beauty at McArthur's Nurseries, Maida Vale, London, W. It is probably one of the most beautiful as well as the largest specimen known to exist. The species formerly known as *Dendrochilum glumaceum* was discovered by Cuming in the Philippine Islands about 1810, and for many years it remained an extremely rare plant in collections. It is evergreen, succeeds in the intermediate-house, and flowers in spring and summer. The *Gardeners' Chronicle* of Nov. 9, 1895, gave as a supplement an illustration of a splendid plant of *Platyclinis glumacea*, with over 100 spikes, grown in the gardens of Sir Trevor Lawrence, Bart., at Burford.

### ODONTOGLOSSUM ROEZLI.

There are at the present time several plants of this species in flower in the plant-stove here. The opinion is generally held that *O. Roezli* is difficult to cultivate, but that is not my experience. Our plant is kept in a stove where the warmth is never less than 60°, and the air is moist. One example growing remarkably well, in a 6-inch Orchid pan, is carrying eight fine spikes, each flower being of good size and substance. *Geo. Burrows, Berwick, Shrewsbury*.

### CYPRIPEDIUM ELLIOTIANUM.

I have at present a plant of this *Cypripedium*, having two flowers on one stem; they are both large and beautifully marked, the under flower, however, is the larger, and measures 10½ inches between

the tips of the two petals. I should like to know if this is an unusual size. *N. C.* [The measurement across the petals seldom exceeds 8 inches. Two flowers on a scape are the usual number under cultivation, although five have been produced. *En*]

*CYMBIDIUM Eburneum.*

There is a plant of this beautiful species of Orchid now in flower here which is carrying sixty-four blooms. The largest number of blooms it has hitherto borne was eighty-six. *C. Burbury, Castle Gardens, Arundel.*

dark velvety purple base of the lip, renders it very striking. The reverse of the flower is even brighter than the face.

THE CONSERVATORY AT OWTHORPE, BOURNEMOUTH.

OF all seaside resorts on the south coast of England, none has increased so rapidly of late years as Bournemouth. The situation of the town has much to recommend it as a health resort, in its breezy commons, which stretch for miles inland, the

THE HERBACEOUS BORDER.

TRILLIUMS AND OTHER PLANTS IN ONE BED.

THERE are few spring-flowering hardy plants which make such a delightful display as a fine group of *Trillium grandiflorum*, and whose requirements are so very simple. The pure white blossoms of the plant, which appear in great quantities, make it so particularly effective, that one wonders why it is not more generally seen in bold masses and groups in most gardens. It is not every kind of soil, however,

FIG. 48.—THE CONSERVATORY, OWTHORPE, BOURNEMOUTH.

*DENDROBIUM NOBILE NOBILIUS.*

From H. Cary Batten, Esq., Abbots Leigh, near Bristol, a flower has been received of a very richly and brilliantly coloured *Dendrobium nobile*, together with the information that it was purchased as an imported plant at a sale at Messrs. Protheroe and Morris' Rooms in May last. In the rich rose-purple hue of its flowers it is quite equal to *D. nobile nobiline*, and too much resembles it to warrant any other name being given to it, although it would be well to distinguish it in the collection where it now is in order that it might be tested side by side with the original *D. n. nobiliss*. The present is a large flower and the broad rose purple band at the front of the lip and facing the cream-white zone and

perfect shelter from the north afforded by the rising ground at the rear, still further helped by the extensive plantations of Pines. As a consequence of the warmth of the situation, many species of plants regarded as tender in parts distant from the sea, even in the southern shires, succeed admirably at Bournemouth; and we shortly intend to present our readers with an illustration of this fact, also taken from the garden of Major-General A. H. Hutchinson. In the present issue we give a view in the conservatory (fig. 48), which exhibits a perfect example of *Alsophila crinita*, occupying the central place; an excessively shaggy plant when young, with long fulvous hairs and large pinnae on the lengthy fronds. It is a native of Ceylon, Java, and Nilghiris.

that suits it perfectly. There are positions in every garden which might be utilised for such things, and made to produce good results. The essential points are a moist bottom and shade, and gives these and some good sandy loam, *Trilliums* will grow fairly well. The best medium is formed of a bed of peat, leaf-mould, and sandy loam, fully 12 inches deep, in about equal parts, and to this may be added one-fourth of short stable-dung. The bed ought to be made in a low-lying place, in partial shade. Apart from these *Trilliums*, such plants as *Corydalis nobilis*, *Orchis foliosa*, the *Dentarias*, *Cypripedium calceolus*, *C. parviflorum*, *C. spectabile*, would if planted in the bed assist in making a summer display; and then later *Gladiolus insignis*, *Lobelia fulgens* in

variety, as also *L. cardinalis*, while taking up but little space, would make a good display of vividly coloured blossoms and foliage. *Lilium pardalinum*, *L. canadense*, *L. superbum*, with *L. speciosum cruentum*, *L. a. Krætzeri* for early autumn. A variety of British Orchideæ would likewise find a congenial home, such as *maculata superba*, *latifolia*, and others, might find a place in such a bed; as also *Primula rosea*, *P. cashmiriana*, *P. denticulata*, would flower before the *Trillium*s; while *P. japonica*, with its great whorls of crimson blossom would come well in summer time. This last would do well inserted in the sloping bank-like side of the bed; while a charming fringe to the margin of such a bed as this would be found in blue and white, and pink *Hepaticas*. It is in such places as these that the *Hepatica* delights, always cool, and nearly all on the moist side. This with overhead shade goes a long way to making these plants evergreen, and especially if the garden be a country one. Nor would I hesitate to plant *Helleborus niger* in such a bed, being certain that these plants would succeed admirably in such a soil and position. The whole of the plants here mentioned should be treated as permanent occupants, and remain for years undisturbed. In very dry seasons, such a bed will probably require occasional watering, which should be performed with thoroughness. *J.*

#### THE FORMING OF AN HERBACEOUS BORDER.

This is a good time to go through herbaceous plants, and reduce any that may have extended beyond their legitimate dimensions. It is also a good time to form herbaceous borders or beds now that plants are beginning to make growth, and consequently, would transplant either out of pots, or from the open, without experiencing any perceptible check in the process of transplantation. No garden of any pretensions to size can be considered complete that does not include an herbaceous border planted with a fairly representative collection of hardy perennial plants.

I would advise readers of the *Gardeners' Chronicle* who have not yet given herbaceous plants a trial, to deprive themselves no longer of the pleasure which the fact of being able to cut a good supply of beautiful flowers of rich, varying, and distinct shades of colour from plants growing out-of-doors several months in the year undoubtedly affords; let them see about forming a border, or bed, as the case may be, at once.

The first step to be taken in this direction is the selection of a suitable place in which to make an herbaceous border or bed; and this, as far as the requirements of the plants are concerned, need not take long to determine, as they will grow and flourish in almost any kind of soil, light rather than heavy in texture, away from the shade of trees. The soil, if lacking in fertility, should have a good dressing of short manure trenched into it, and should the soil be of a heavy nature, it can easily be reduced to the requirements of the plants by a liberal allowance of leaf-mould, burnt-earth or wood-ashes being incorporated with it in the course of trenching or double-digging it.

In planting, set the tall-growing plants in the back and succeeding rows to front of border, according to the heights which the several kinds and varieties planted attain to. These, however, should vary from 6 to 15 inches in height in each irregular row from back to front, so as to produce a natural-like broken-up surface, taking care at the same time to arrange the plants so that they may not clash with one another in regard to their colour when in flower. And also bear in mind that subjects which come into flower at different times be well intermingled, that is, avoid mixing together plants which flower at about the same part of the season, and which, when out of bloom, necessarily leave large bare patches in the floral picture.

*Helianthus* (perennial sunflower), *Delphinium formosum*, and its varieties, *Helenium autumnale grandiflorum*, *Galega officinalis compacta*, *Papaver* (Poppy) in variety, *Phloxes*, *Eranthis robustus*, *Boltonia asteroides*, *Pyrethrum nigrosum*, *Solidago* (Golden Rod), *Spirea Aruncus*, and *S. gigantea*,

are among some of the most suitable subjects for planting the back row in a fairly wide border, and for planting in the second and third rows. *Doronicum plantaginifolium*, *D. p. Harpur Crewe*, *D. p. excelsum*, *Rudbeckia nitida*, *R. Newmanni*; *D. Pardalianche*, *Eupatorium ageritoides*, *Echinacea purpurea*, *Echinops Ritro*, *E. gigantea*, *Achillea eupatorium*, and others; *Aconitum autumnale*, *A. Napellus album*, *Asclepias incarnata*, *Asphodelus luteus*, *A. ramosa*, *Aster Archer Hinde*, *A. grandiflora Lady Trevelyan*, *A. Nova-Angliæ rubra*, *A. Madame Soymer*, *A. Amellus bessarubicus*, *A. Robert Parker*, *A. pulcherrimus*; and for planting nearer the front such subjects as *Aster amelloides cœlestis*, *A. japonica*, *Anemone japonica alba*, *Aquilegia canadensis*, *Armeria cephalotes*, *Dielytra spectabilis*, *Eryngium alpinum*, *Funkia Fortunei*, *Gaillardia*, in variety; *Arabis incida variegata*, *Heesperis matronalis fl.-pl.*, *Double Sweet Rocket*, *Hemerocallis Dumortieri*, *Irises* in variety, *Lilium candidum*, *Lychnis chalcœdonica*, *Narcissus*, *Hyacinthe*, *Megasea*, *Veronica Henderanni*, *V. gentianoides*, *V. maritima alba*, *Tiarella cordifolia*, *Tradescantia virginica alba*, *T. cœrules*, *Aubretia* in variety, *Wallflower*. *Scilla sibirica*, and *Snowdrops*, together with the *Anbrietias*, should be planted in tufts, from 3 to 9 inches from the edge, so as to avoid straight lines and all formality of arrangement in planting.

Allow a space of from 3 to 4 feet between the tall-growing *Asters*, *Sunflowers*, *Eranthis robustus*, *Boltonia asteroides*, *Rudbeckias*, and other strong-growing plants, and from 1½ to 2 feet between less robust-growing subjects. *H. W. W.*

#### INJURIOUS INSECTS.

MISS E. A. ORMEROD has just issued her nineteenth report, which embraces 152 pages of interesting and valuable matter relating to injurious insects and common garden and orchard pests during the year 1895, with methods of prevention and remedy.

The subject-matter, which is illustrated by drawings, should prove of the greatest interest to gardeners and fruit growers—in fact, the value of the work of this lady can scarcely be over-estimated. The portion calling for our especial attention is that relating to the "Eyed Hawk Moth" which attacks the Apple; the Bean-seed beetle; the root-gall weevil, which injures the Cabbage; the Gooseberry and Currant saw-fly, and red spider; the orchard caterpillars; and the Plum-tree and Strawberry beetle, which frequently do immense mischief to these fruits.

The great green caterpillars of the Eyed Hawk Moth appear to be more of an orchard pest than has generally been supposed. They seem to have done considerable damage to young Apple trees during 1895. Usually the infestation does not appear to be noticed until it forces itself on our attention by the leafage of the attacked boughs being stripped.

The Bean weevil of England (*Bruchus rufimanus*) is both a common and a destructive insect. The method of attack is for the beetle to fly to the blossoming Beans, and to lay its eggs on the young seed-vessel in the centre of the Bean-flower, whilst it is still quite in embryo state. From these eggs the grubs soon hatch, and make their way into the growing Beans. The amount of injury depends partly on the amount of what would have been the seed-leaves which is eaten away, and the consequent amount of removal of what would have fed the young plant in its first growth, and also very materially whether it is the nature of the pest to feed on the germ in the seed. This shows the great importance of examination of seed Beans and Peas before purchase.

The small knob-like excrescences on Cabbage-roots, and also on Turnip-balls, which are caused by the presence of the grub of a small weevil-beetle are a common malformation, and though the plants would be better without them, Miss Ormerod does not consider them in general to do much mischief.

Observations on insect pests last spring were of some special interest, as showing that the grubs were in no way injured by the long-continued and very unusually severe cold of the preceding winter, and some specimens examined revealed an amount of serious injury from the severity of gall infestation which the author had never met with before.

Notwithstanding the severe and long continuance of cold in the early part of the last year, the Gooseberry red-spider, which was the cause of great loss to growers in the spring and early summer of 1893, and also of 1894, re-appeared in the middle of March and early part of April in the past season of 1895, to an amount which caused serious anxiety as to the extent of injury that might again be coming on; the hot bright days which followed, however, fortunately did much to mitigate the evil. We find also from the report that the excessive cold had certainly no effect in lessening infestation of the common orchard and fruit-tree caterpillars, as for instance, the looper caterpillar of the Winter Moth, which did much damage in various localities, not only to fruit-tree leafage, but also, and on a broad scale, to Oaks.

The attacks of "ground beetles" to Strawberry fruit, which in 1894 did much mischief at Woodborough in Nottinghamshire, on the grounds of one Strawberry grower, showed itself again in the past season, and on a much more serious scale. It appeared in many places in the district in great numbers and attacked the fruit just when it was beginning to ripen, so as to cause considerable loss. The same beetle has been found to attack young plants of Mangold when they are just above ground-level. *J. J. W.*

#### EXPERIMENTS ON TRANSPIRATION.

In the *Botanische Zeitung*, E. Stahl has described a number of interesting experiments, on the results of which he bases a method by means of which it can be demonstrated to the eye whether a plant loses water by transpiration, and also through what parts of its surface the loss takes place. For this purpose A. Marget had formerly employed white paper impregnated with a mixture of mercurous and palladous chlorides, or with palladous and ferrous chlorides and tartaric acid. In the dry state the paper was whitish-yellow, but it became darker, and finally black as it absorbed water. When applied to the transpiring surface the loss of water could be estimated by the change in colour, and at any point the colour could be fixed by simply dipping the paper in a solution of ferric chloride. Other investigators, however, have found Marget's method unsatisfactory, and Stahl has resorted to the use of cobalt salts, especially cobalt chloride. He soaks strips of Swedish filter paper in an aqueous solution (1 to 5 per cent.) of this salt and dries them, their colour then varying from light to deep blue, according to the strength of the solution employed. As the paper becomes moist, the colour changes to pink and then to white. In use a small piece of the cobalt paper is thoroughly dried, placed in position on the plant, then held firmly against the surface, and protected from the air by means of a thin piece of glass or mica, which is held in place by small clamps. In cases where leaves have stomata on the under side only, cobalt paper on that side is reddened very quickly, often in a few seconds, while that on the upper side of the same leaf may retain its original colour for several hours. Where stomata occur on both sides, the reddening is proportionate to the number, and in the case of *Trifolium repens*, the leaves of which have more stomata on the upper than the under side, the paper fades more rapidly on that side. No reddening occurs in the case of slightly-wilted leaves, or in any instance where the stomata are closed on account of an insufficiency of water in the plant, even when the leaves are exposed to the sun. The slight extent to which evaporation through cuticularized epidermis takes place is thus demonstrated, whilst fully turgid leaves applied with water are said to illustrate the same fact. *Pharmaceutical Journal*.

TREES AND SHRUBS.

HAMAMELIS ARBOREA.

FROM the end of the month of January to the middle of March this year, there has been no hardy shrub in flower which in beauty equalled the Japanese Witch Hazel, and never do I remember to have seen it so fine as it has been this season. Near to the Orchid-houses at Kew there is a group of some half-a-dozen plants which are 6 feet to 8 feet high, and have every one of the smaller twigs covered with closely-set golden-yellow flowers. These plants are happily situated in having a large Pine tree behind them, against the dark foliage of which the thin, crooked branches are seen traced in

LONICERA STANDISHII.

Whatever this Honey-suckle may lose in the absence of colour in its flowers, is amply compensated for by the early date at which they appear, the exceeding sweetness of their perfume, and the freedom with which they are borne. It belongs to the shrubby (as distinguished from the climbing) section of the Loniceras, and was originally introduced from China by Fortune on behalf of the Royal Horticultural Society. The flowers are white, produced in pairs on a short peduncle, several pairs clustering round one node. Nearly allied to this is *L. fragrantissima*, another introduction of Fortune's, and now also in bloom. It differs chiefly in the leaves, which are shorter and more rounded than those of *L. Standishii*; and

probably, to their resemblance to the Yew, they are not much planted in gardens. They form neat spreading shrubs, usually dense of growth, with long deep-green foliage, and succeed best in the shade, and when planted in mossy, cool ground. *A. D. Webster.*

EPIDENDRUM × ELEGANTULUM.

ON the occasion of the meeting of the Royal Horticultural Society on the 10th inst., Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, exhibited a remarkable and beautiful cross in Epidendrum under the above name (fig. 49), the parents being *E. Andreoso-Wallisi* ♂, and *E. Wallisi* ♀. The plant has the neat habit of the first-named, but the flowers, which are large, are like the latter, and have the segments flatly displayed. The sepals and petals are rich dark brown with a whitish space at the base, and beautifully spotted with red-brown over the greater portion of the area, the spots margined with a thin yellow line. The lip is white, yellow-coloured at the base, and spotted with rose colour.

The plant shown possessed three stems, each surmounted with a corymb of blossoms, five in number in one case, and two each in the others.

THE FLOWER GARDEN.

(Concluded from p. 326.)

MAKING FLOWER-BEDS AND BORDERS.—If there is any likelihood of water rising to within 18 inches of the ground-level at any time, the soil should be excavated to that depth, and 6 or 9 inches thick of brick-rubble or clinkers laid over the bottom of each bed, breaking it fairly fine on the top, as drainage; and should the natural soil be of a heavy and consequently cold nature, a liberal allowance of leaf-mould should be incorporated with the best of it, and in sufficient quantity to fill the individual excavated spaces 9 inches higher than the ground-line in the middle, so as to allow for the loose soil settling down a little in the course of a week or two. This mixture will form a good rooting medium for all kinds of bedding plants. When the above-mentioned work is completed, the ground should be finally raked over and turfed—that is, if turf perfectly free from the roots of noxious weeds can be obtained. The turves should be cut at 3 feet long, 1 foot wide, and 1 inch thick, these being laid closely and evenly together over the spaces reserved for greensward. This done, a little light, fine mould—or leaf-mould where the latter is plentiful—may with advantage be strewn over the surface, and then be brushed well over with a stiffish besom so as to fill up any crevices there may be in the turf, and at the same time serve as a slight manurial top-dressing, and a few days later (all the better if rain has fallen in the meanwhile) roll with a heavy roller to produce a firm and even surface. But where the obtaining of turf of the description indicated cannot be relied upon, it is much better and cheaper to sow the ground over thickly and evenly with some good mixture of grass seed, at the rate of seven or eight bushels per acre, any time between February and October, but the sooner the seed is sown in spring the better, covering it lightly with fine, light soil, raking this over, and rolling as soon as it may be done without the soil sticking to the roller, scything over and machining as soon as the blades of young grass have become numerous and strong enough to benefit by the operation—say about three weeks from the time of sowing the seed—scything it over a few times before using the machine lawn-mower. Vases to be planted alternately, and in due time with spring and summer-flowering plants, may with advantage be placed at short intervals along the terrace-walks, as well as at certain points on those communicating therewith.

HARDY FERNERIES, &c.

In the vicinity of most gardens and houses may be found shady and, perhaps, objectionable nooks, in which flowering or variegated-leaved plants will not flourish. These may be rendered

FIG. 49.—EPIDENDRUM × ELEGANTULUM.

gold. When planting this shrub, the advantage of some such background (Pine, Holly, Yew, &c.) should be borne in mind, for they themselves are as bare of foliage now as the common Elm. Examined individually, the flowers prove to be curious in form; there are four petals, each nearly 1 inch long, perhaps one-sixteenth of an inch wide, twisted, and wavy. The sepals are short, rounded, and crimson. Although the American species (*Hamamelis virginica*) seeds freely in this country, such is not the case with *H. arborea*, and it has to be propagated by grafting on seedlings of the former. It is not yet a common shrub, but its beauty is so striking that it deserves to be seen in every garden. The other Japanese Witch Hazels—*H. japonica* and its variety *Zaccariaiana*—have flowers of a paler yellow, but although valuable in flowering so early in the year, they are inferior to *H. arborea*.

while they are nearly glabrous, those of *L. Standishii* are covered with fine hairs, and have a distinctly ciliate margin. The name *fragrantissima* has been applied to the evergreen species known as *japonica*, *Halleans*, &c., and it is in consequence frequently described as evergreen, being in reality as deciduous as *L. Standishii*. *W. J. B.*

CEPHALOTAXUS FORTUNEI.

At the present time this uncommon shrub forms a very ornamental object from the abundance of the male flowers, which impart a yellow tint to the sombre foliage. I do not remember to have seen the pretty Plum-like fruit produced in such quantities as during the past season, in some instances the branches being literally bent down with the weight of the fruit. *C. drapsacea* has produced fruit quite as freely. Both species are interesting; but owing,

interesting and beautiful spots by placing thereon somewhat irregularly together old roots, ragged stones, or clinkers, raised to the desired but irregular heights by the addition of light soil, or soil rendered so by the addition of leaf-mould, and then planting amongst them hardy British Ferns, in variety, making the soil firm about the roots in planting.

A few standard trees of light-flowered Rhododendrons planted in conspicuous places in or adjoining the flower-garden, singly in small beds—say 4 or 5 feet in diameter—in peaty soil, and carpeted with trailing plants of the delightfully fragrant pink-flowered *Daphne Cneorum*, form objects of great beauty during the summer months. Single specimens of *Kalmias*, Tree or Moutan *Pæonies*, *Laurustinus*, Sweet Bay (*Laurus nobilis*), Weeping Ash (*Fraxinus pendula*), Heather (*Calluna*), *Capreaus Lawsoniana*, *C. Lawsoniana erecta viridis*, and *Fraseri*, Portugal Laurel, *Aucubas* (both forms), Pampas-grass (*Gynerium argenteum*), &c., are very telling subjects when judiciously disposed, as also are the several delicate and richly-coloured and finely-cut foliage of the Japanese Maple (*Acer*), now in cultivation. *Ræbeds* and *rosaries* should also be included. *H. W. Ward.*

## FORESTRY.

### THE LARCH DISEASE.

A STRICTLY impartial reader of "J. S. W.'s" letter on this subject in the *Gardeners' Chronicle* of February 23, might be excused for failing to see the utility of quoting a passage in which the name of a disease is mentioned, and immediately afterwards expressing a doubt as to the writer of the passage being aware of its existence. One might almost be tempted to ask whether "J. S. W." knows that *Peziza Wilkommii* and the Larch disease are one and the same thing, were it not that we are informed that the late Mr. McGregor and a Welsh nobleman have, together with your correspondent, definitely settled the whole matter, presumably to their entire satisfaction. I have always noticed that when sound arguments fail in a discussion, a landowner (who is either large or does things extensively), is invariably introduced, like Grandfather Smallweed's "friend in the City," to cover a retreat, or give an air of respectability to irrelevant statements. It would be interesting, however, to have "J. S. W.'s" particular disease diagnosed, for doubtless he has a special strain of his own which "culture and situation cannot modify." The virulence of the disease, he tells us, has nothing whatever to do with the vitality (or lack of it), of the host. The fact that our nurserymen are able to sow it, and that it runs under conditions which are the most favourable possible for its host, are further proofs that "J. S. W.'s" disease differs in important respects from the ordinary one. The Larch disease, as I know it, causes what is usually known as a canker or blister, but which in reality is the death of the cambium layer, and this dead spot becomes larger year by year as the fungus which causes it extends. Now, this is exactly similar to what takes place when an Ash or Beech is attacked by *Nectria ditissima*, and trees may be seen quite as badly infected with the latter as Larch is frequently infected with *Peziza*. Other parasitic diseases might be mentioned. The reason why the Larch disease is so prominently brought to our notice lies in the fact I have already mentioned, viz., that the Larch has been planted up-hill and down-dale, in highlands and lowlands, and in every sort of soil and situation, with as little regard for its tastes and requirements as is paid to a fencing-post. If this explanation is not the correct one, why is it that a certain proportion of plantations succeed, or that certain parts of a plantation succeed better and are more free from disease than the rest? It is sheer nonsense to assert that the Larch is a total failure in this country so long as we have well-grown plantations in which the disease is little more than a botanical curiosity (if anything so common can be considered curious). If soil and situation, and the

influence they have upon the growth of the tree, are immaterial factors in the spread of the disease, there is no reason whatever why the condition of Larch plantations should vary to the extent it does. The fact is, it goes against the grain with some persons to own they have made a mistake, and those who plant much invariably do make mistakes sometimes. With the Larch disease always present, it is not surprising to find it assert itself when its host becomes stunted and enfeebled by unfavourable surroundings or conditions of growth. Then is it that our planters put on sackcloth and ashes, and fly to restoratives which the nurseryman dispenses to the tune of a few pounds per thousand. "J. S. W." kindly mentions the Japanese and American Larcher, the latter of which do so well in Canada. We have also been told that the Tyrolese Larch does very well in Switzerland, but it does not do everywhere here. Will the Canadian Larch have the same fault? *A. C. Forbes.*

## THE WEEK'S WORK.

### THE ORCHID HOUSE.

By W. H. WHITE, *Burford, Dorset.*

**THUNIAS.**—These deciduous plants, which naturally have a complete rest in the winter season, and which are pushing up growth from the base of the old pseudo-bulbs, stand in need of attention as regards affording fresh rooting material. The plants should be turned out of their pots, the whole of the soil shaken from them, and the dead roots cut away and then re-potted. The usual mode of cultivating Thunias is in clumps of pseudo-bulbs, and it is a very convenient one, as when the plants are in bloom the effect is better than when they are cultivated singly in small pots. It is important to have clean pots, of 7 or 8 inches in diameter, which should be half filled with crocks, over which a thin mass of fibry loam should be placed, and into which the roots will penetrate, greatly to their benefit, at about the time that the flower-buds appear. Plant the pseudo-bulbs about 2 or 3 inches apart, taking care to keep the young growths just below the rim of the pot, and fill up to their base with peat, loam, and sphagnum-moss, and sufficient clean crocks to maintain porosity in the compost. It should be here stated that every pseudo-bulb should be fastened to a neat stake. Place the pots in the lightest position in the East Indian or Dendrobium-house, standing them upon inverted pots if necessary, to bring them near the roof; for, unless they get abundance of sunlight, they will not bloom well. For the next few weeks water them carefully, increasing the quantity when the new roots push into the compost. When established, an occasional dose of weak liquid-manure is beneficial to them. The following are of easy cultivation, *Marshallii*, *Benzonia*, *alba*, *candidissima*, *pulchra*, and the pretty hybrid *Veitchiana*. All of these varieties of Thunia may be readily propagated by taking off the back pseudo-bulbs in the month of June, cutting them off at the joints into lengths of about 4 to 6 inches, and inserting them firmly as cuttings into small well-drained pots, in a mixture of chopped sphagnum and coarse silver-sand. When fresh shoots are pushed forth, grow them along quickly in strong heat.

**ARUNDINAS.**—The pretty *Arundinas bambusaefolia* and *Philippii* are terrestrial Orchids, which may be similarly treated to Thunias.

**SPATHOLOTTIS.**—The varieties *S. Lobbi*, *S. Fortunei*, *S. angustorum*, *S. aurea*, and *S. Regnierii*, will soon begin to grow anew, and should be repotted into the same kind of compost as that advised for Thunias. These may be grown in the warmest house in a moist light position. The *Dendrobium* seedlings, or as many of them as are starting to grow, and require repotting, should have attention. In carrying out this operation, avoid putting them in pots that are larger than the tiny plants require, and as a potting material use sphagnum-moss and clean crocks broken very small, which must be pressed firmly around them. Until they reach the flowering stage, these seedlings make the most progress if no peat be used about the roots. Suspend the pots in a hot moist stove or propagating-house, and do not afford much water before the roots obtain a good hold of the compost, when it may be abundantly given. In the intermediate-house, *Miltonia vexillaria* is in full growth, and in consequence the plants stand in need of abundance of root moisture. Each growth should be periodically

examined for insect-pests, and if any are remarked, apply the usual remedies. The prevailing weather is in every way suitable for the growth of *Miltonia*, as it permits of abundance of air being admitted to the house without fear of damaging the leaves. Do not make use of heavy shading over the plants, which causes weak, flimsy growth, but allow a moderate amount of sunshine to reach the plants, with plenty of ventilation to strengthen them. *Miltonia spectabilis* and *M. Moreliana* should have the same kind of treatment.

**LÆLIA MONOPHYLLA** should be placed in well-drained pans of peat and sphagnum-moss, and suspended in the coolest part of the house until summer comes, when the *Odontoglossum*-house will be found a suitable place for it. The singular-looking *Nanodes Medusa* may also be repotted, and hung up near to the roof-glass in the cool-house.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Bollington Hall, Burton-on-Trent.*

**GRAFTING.**—The season for grafting is near, and as soon as the sap begins to ascend and the bark parts easily from the wood, is the time for a beginning to be made with grafting, remembering, however, that it is better to be a little late than too early. There are many methods of grafting, but in private establishments it is seldom that more than two are employed, viz., tongue or whip-grafting for young stocks and small branches, and crown or rind-grafting for larger trees. It is not necessary for me to enter into the details of preparing the stocks and scions for either method, but it may be stated that in order to be successful in the grafting of either young or old trees, the stock should be healthy, and the scions taken from well-ripened shoots, neither too soft or large, nor weakly, and which have been cut some time previously, and laid in some cool shady place, with the intention of keeping the buds in a dormant state. Grafting should be done expeditiously, the various cuts made clean, therefore a number of sharp knives should be employed, and the inner bark and cambium layer of both stock and scion must be made to fit closely on one side at the least. Grafts may be kept in position by ties of soft bast, raffia, worsted, &c., the last-named being the best if grafting-wax is used to cover the graft. When clay is used, it should be well beaten with a mallet some time before it is wanted for use, all hard substances being removed, and sufficient water added to bring it to an easily-used consistency. Before it is actually made use of, cow or horse-dung, or, failing these, chaff should be mixed with it in the proportion of one-third to clay two-thirds. The chief use of clay or wax in grafting is to exclude the air and moisture, and it is very essential to success that it be well worked into the crevices; and when sufficient has been used, to sprinkle a little dry sand or finely-sifted coal-ashes on, to prevent the clay adhering to the hand when finishing it off. A little moss tied on the clay, and damped with a syringe every two or three days for a time if the weather be dry, will prevent the cracking of the clay. If wax is used, enough should be put on to well cover the tying material, which will suffice to exclude the air. The grafting-wax sold under the name of "Homme-Lefort" is a very convenient form for use in grafting, being sold in a cold state ready for use.

### THE KITCHEN GARDEN.

By G. HERRIN, *Gardener, Dropmore, Maidenhead.*

**CELERY.**—Preparations should now be made for sowing seed for furnishing plants for the main crop. Where Celery is required in large quantity, a hot-bed frame affords the simplest means of raising the plants. The hot-bed should be made of equal parts of stable-litter and hard tree leaves, which have been prepared by frequent turnings and mixings, and it may be made 2 feet in depth, and wider than the box. Fill the latter also to within 6 inches of the glass with the warm materials, treading them down evenly, and on this spread a layer of leaf-mould 2 inches thick, upon which place the soil in which the seeds will be sown. The soil must be of some light kind, and should be passed through a 3-inch meshed sieve, and be an inch in depth after being made moderately firm. A few days after making up, the seeds should be broadcasted thinly, and very slightly covered with finely-sifted soil. The frame may be kept covered with mats till the seeds germinate. When a small quantity of plants is required, boxes or pans may be used, placing them in a vinery or other structure,

having a temperature of about 60°. The pans, &c., should be covered with pieces of slate or glass, removing it when the seedlings appear. Varieties of Celery are many, and of these I find Early Rose suitable for early and mid-season use, and Sulham Pink and Standard Bearer excellent for late use. Plants from the earlier sowing will now be ready for pricking out, which should be done at 3 inches apart each way, on a slight hot-bed made similar to the seed-bed described above. The soil should be finely-sifted and loamy, and have about one-third leaf-mould mixed with it to ensure the plants lifting with good balls. Air carefully, and shade from bright sun till the seedlings are partially established; and use tepid water when moisture is required. Heads of Celery for late use should now be lifted from the growing quarters and laid in trenches in some place shaded from the sun—on the north side of a wall by preference—where, covered with the earth, so as to exclude the light from the blanched portion, they will remain tender and fit for use for some weeks longer. Celery Standard Bearer is now very good here, and shows no signs of bolting or decaying.

**CELERIAC, OR TURNIP-ROOTED CELERY.**—Seeds of this useful root should also now be sown; and the treatment described for blanched varieties will, for the present, apply also to this plant. The roots are very useful for stewing and flavouring [and salads, &c.]. The plant should receive more general cultivation than it does at the present.

**ONIONS AND LETTUCE.**—With a continuation of mild weather, autumn-sown Onions may be transplanted, the blanks in the rows where any exist being filled, and others made if necessary. These plants are now making free growth, and the lifting will require to be carefully done, and the planting done firmly to ensure any good results. Lettuce, both autumn and spring-sown, may be similarly treated. The latter, which will have been raised in frames, may be planted in any spare spaces at the foot of south wall, where, if the soil be made moderately light and rich, they soon mature, and form nice little heads, tender and well blanched. The variety, Early Paris Market, is excellent for this first planting. Another small sowing of Lettuce should now be made in the open quarters, and may consist of Golden Queen, Cabbage, and Superb White Cos.

### PLANTS UNDER GLASS.

By JNO. MCINTYRE, Gardener, Woodside, Darlington.

**SEED SOWING.**—The seeds of many plants grown in the greenhouse should now be sown. Balsams, if sown now, will come into flower in June, and if well grown, add much to the gay appearance of the greenhouse or cool conservatory. The Camellia-flowered varieties, are those mostly grown, and to grow them well, the seeds must be sown in leaf-soil and silver-sand, and the seed-pots plunged in a gentle bottom-heat, a dozen seeds being enough for a  $\frac{1}{2}$ -inch pot. As soon as the seedlings have got their first rough leaves, prick them off singly into thumps, and shift repeatedly till they reach 7 or 8-inch pots, in which fine plants may be obtained with proper culture. In the later shifts well-rotted leaf-soil two parts, and one each loam and dried cow-mannure should be used. Balsams are gross feeders, and benefit greatly from copious waterings with liquid-mannure; and to grow them to perfection, the plants should be plunged in bottom-heat of 75° to 80° till they come into bloom, taking the precaution to afford ample ventilation meantime.

**CELOSIA.**—These tender annuals are useful for grouping in conservatory, but there are several strains, and only the superior ones should be grown. When the gardener gets a good strain, he should endeavour to keep and improve it by selecting only the best forms as seed-bearers, throwing the others away before contamination occurs. Seeds may be sown forthwith, and again in the middle of April, and even later. The general treatment in the early stages is that recommended for the Balsam, but in the later a shelf in the stove near the glass, where there is plenty of sunlight, is a suitable place. For small plants for the side stages, and for indoor decoration, 5 inch pots will be large enough for the final shift; but for large specimens 8-inch pots are not too large. At a potting soil, use loam, leaf-mould, and sharp sand.

**TUBEROUS-ROOTED BEGONIAS** sown last autumn may now require to be potted singly into thumb-pots.

**CYCLAMENS.**—These plants are not, as a rule, well done in private places, gardeners seeming to rely more upon plants obtained from the nurserymen

than on own raised ones. While this may be the surest way of having good plants, still, fairly good results are achieved by commencing with a packet of seed saved from an excellent strain of Cyclamen persicum, which should have been sown in the autumn. The seedlings thus raised will now be ready for potting into thumps in good loam and leaf-mould, with a small quantity of silver sand. A span-roof house or pit are the places in which the Cyclamen grows best, and the pots should be stood on finely-sifted coal-ashes or other non-conducting material which holds moisture, and affords a cool bottom for the plants to stand upon. Repeated re-pottings, small at each time, are very essential to good results, the size reached at the final shift being 5 or 6-inch pots. During the early stages of growth, a certain amount of shade from bright sunshine is required, but it should not be of a fixed kind if it can be avoided; and occasional sprinklings of Clay's Fertiliser do good during the later stages of growth. A temperature a trifle higher than that of the intermediate-house is required till full size is reached.

**CALCEOLARIA HERBACEA.**—These greenhouse annuals should now receive their final shift into 6, 7, and 8-inch pots, according to the size of the plants; and good yellow loam, mixed with one-fourth rich manure, preferably cow-dung in a dry state, and sharp sand being used at this repotting. Let the plants be down rather low in the pots, and pot firmly, affording water sparingly for a few days afterwards. A shelf in the greenhouse near the glass, or a cold frame which frost cannot enter, are suitable places till the plants show for bloom.

**PRIMULA SINENSIS.**—Seeds may now be sown for furnishing early-flowering plants, sowing again in about one month. The soil for filling the seed-pots may consist of peat one-third, loam finely-sifted one-third, leaf-mould one-third, and one-sixth of the whole sharp sand; put plenty of crocks into the pots or pans with sittings of the soil over these, and fill up to within half-an-inch of the top with the above mixture, leaving this rather rough on the surface. Sow the seeds thinly and evenly, but do not cover it, watering the soil with a fine rose can, doing this sufficiently. Before the pots are put into the mild hot-bed, cover them with a piece of thick brown paper, which keep on till the seed begins to germinate. It is the proper course to let the seedlings remain in the seed-pots or pans till they have several leaves and a good quantity of roots, before pricking them off singly into pots.

### THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring.

**PRUNING EVERGREEN SHRUBS, ETC.**—Common Laurel, Rhododendron ponticum, growing in the shade of trees, that may have become unsightly in consequence, or because of a straggling growth, may now be cut back. If the operation be done at this time of the year, it soon causes the stems to become brittle with young shoots, and thus presenting a tidy appearance. Plants of Ivy on walls and trellises may have the fore-right shoots cut back, and dead leaves and shoots removed. Walks which consist of binding gravel, and the lawn, should be well rolled, the former at least once a fortnight; and if they can be got into good condition before the drying north and east winds occur, will remain good for a long while, with but little more labour expended upon them.

**THE FLOWER-BEDS.**—These should occasionally be attended to, and all decaying leaves removed from the plants, and tree-leaves which may have found their way there cleared out from among the plants. All conspicuous blank spaces should be made good with plants and bulbs from the reserves. Some of the flower-beds are already gay with the fast-opening flowers of Dutch bulbs and other subjects.

**ASTERS, STOCKS, ZINNIAS, EVERLASTING PLANTS, ANTIRRHINUMS, LARKSPURS, ETC.**—Seeds may now be sown on beds in frames, on a gentle hot-bed, made up of about equal parts of fresh stable-mannure and hard tree leaves, to a depth of 15 or 18 inches. When the rank heat is dissipated, the hot-bed should receive a surfacing 3 or 4 inches thick of fairly rich light, somewhat sandy soil, on which the seeds may be thinly sown, lightly covering them with finely sifted soil. As soon as the seedlings appear, abundance of air should be afforded on favourable occasions by day, removing the lights altogether if very warm weather prevails. By this means sturdy growth is encouraged. It is also advisable to leave a little air on the frame during the night, at least as long as the danger from steam from the hot-bed

materials is present. The frame should be covered at night more or less according to the weather; the temperature may be kept at about 55°.

**VIOLETS.**—The beds or borders in which these plants will be grown during the summer should be prepared betimes in a partial shady situation. In hot, dry sunny situations the Violets get infested with red-spider and badly crippled, but in partly shady ones there is less danger from this cause. The ground should be dressed with decayed manure, such as that from a spent Mushroom-bed; and if leaf-mould can be afforded, so much the better, and afterwards be bastard-trenched or deeply dug. A good time to divide and transplant the plants is during the month of April, and if possible a showery day being chosen for the job. The stronger plants should be pulled into small clumps or single crowns, each with some amount of roots attached, and planted in rows about 1 foot apart, affording water as soon as the planting is finished. Some gardeners prefer to increase their stock of plants from runners, but unless the conditions are very favourable this method is not to be recommended, runners being not produced by the old plants till late in the season. The runner forms undoubtedly an excellent plant where it can be got early. Plants which have been forced should not be used for propagating purposes if others can be obtained, the results seldom being satisfactory.

### FRUITS UNDER GLASS.

By W. POPE, Gardener, Highclere Castle, Newbury.

**EARLY VINES.**—When the stoning of the berries is finished, and the second swelling has begun, the night temperature may be advanced to 70°, taking advantage of sunshine to shut up early in the afternoon, and thus, by securing all the sun-heat possible, the temperature in the early hours of the night will be maintained without much fire-heat being needed. When colouring commences, more air should be afforded, and the moisture in the house gradually reduced. Inside borders at this stage should be afforded a good application of warm liquid-mannure, to stimulate root-action, and assist the final swelling and colouring of the berries. A mulch of fresh short stable litter should be placed on the border. Damping the vine at closing time must be continued till the colouring of the fruit is well advanced, then reducing it gradually in amount till it is altogether discontinued. Should red-spider make its appearance, the infested leaves must be carefully sponged with warm water and soft-soap. In the case of Madresfield Court, and other varieties, the berries of which are liable to splitting at the point when they begin to ripen, less air and moisture should be afforded the Vines, and a constant and regular circulation of warm buoyant air maintained in the vine; and rather than stop the laterals very closely at this period, an extension of three growths should be allowed, if it may be done without crowding the foliage too much, root-action being intensified thereby. In the case of pot-Vines, great care is necessary in affording water at the root after colouring begins, only just as much as the Vines need, and which will keep them healthy and vigorous. No manure-water should be afforded the pots after the fruit begins to colour.

**SUCCESSIONAL VINES.**—The disbudding, stopping, and tying down of shoots will now require almost daily attention, the practice of letting shoots extend, to be afterwards removed or shortened back severely, being inimical to successful culture, and is almost certain to be followed more or less by banking. The stopping of shoots should be done at the second or third leaf beyond the best bunch, according to the space at command, and by pinching out the point of the shoot; and in the case of free-setting varieties, as the Black Hamburgh, superfluous bunches should be cut off as early as a selection of the bunches is possible. Such free varieties should also be thinned as soon as the berries are formed, or injury to the berries will result.

**MELONS.**—Plants in bloom need a dryish air, and to be ventilated freely. It is necessary to fertilise the blossoms daily, till a full crop of fruit is set, and to stop all lateral shoots at one leaf beyond the fruit. The aim should be to keep the bottom-heat at from 80° to 85°, affording enough moisture at the roots to preserve the plants from flagging. When the fruits begin to increase in size visibly, water may be more freely afforded, and humidity in the pit or house maintained by damping the bed, &c., with an occasional syringing of the bine in bright weather at closing time.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

## APPOINTMENTS FOR THE ENSUING WEEK.

## SHOWS.

TUESDAY,	MAR. 24	Royal Horticultural Society's Committee's Show.
WEDNESDAY,	MAR. 25	Shropshire Horticultural Society's Spring Show. Torquay Gardeners' Society's Show.
THURSDAY,	MAR. 26	Hort. Show at People's Palace, London, E. (three days).

## SALES.

MONDAY,	MAR. 23	Azaleas, Ferns, Roses, Gladioli, &c., at Protheroe & Morris' Rooms.
TUESDAY,	MAR. 24	Imported Orchids, from Mr. P. McArthur, at Protheroe & Morris' Rooms.
WEDNESDAY,	MAR. 25	Great Sale of Japanese Lilies and Plants, Tuberoses, Carnations, Peonies, Palms, &c., at Protheroe & Morris' Rooms.
FRIDAY,	MAR. 26	Orchids, from Messrs. F. Sander & Co., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—44°.

Winter grafted Roses. The method of grafting Roses touched upon by a correspondent in these pages on February 29, is by no means a new thing in this country, and was practised very commonly in good gardens in the first half of the century. But for some reason it has fallen into abeyance; still, it is worth while to revive it where labour in the garden is not scarce, and there are a few pits and frames which can be utilised for these purposes. Dog-rose stocks of various heights used to be potted in 48's and 32's after being trimmed, and the roots reduced to a size that enabled their being potted; and it does not matter if the stem goes into the middle or is at the side of the pot. This was done in October, and the stocks were set aside till the end of December, being watered at the root when dry. They were then put into a pit, with a temperature of 60° by day, and 55° by night, and kept fairly moist and close. A pit of two lights will hold a great number, as the pots may be placed on one another two or three deep. Scions were taken off at that time, and laid-in in a cool, moist, frost-proof place, in readiness for use when the bark of the stock was easily detachable from the wood. This occurs in about ten or twelve days after placing in heat.

The methods of grafting are immaterial—tongue, whip, crown, or rind; the chief point

being a union of the cambium-layer of stock and scion. As a good deal of sprinkling or syringing is necessary—well, at least twice a day—grafting-wax was found to be more trustworthy than clay, and easier to apply. If L'Homme Lefort's wax is not at hand, tallow and bees-wax, applied warm, will do as well. It is used merely to exclude the wet. The lights were kept close, and in a fortnight most of the grafts were taken; and the ties had to be cut in one or two places, so that they should not clip the bark too tightly, and those stocks on which the scions were making growth were removed to a slightly less close pit, where the warmth was also not so high, but had, say, the temperature of the intermediate-house. Those which showed flower, and most of them did, were grown gently on for flowering in the greenhouse in March and April; and all were by degrees inured to the air in time for setting outside in May. These standard Roses come in usefully for lighting up masses of Camellias and other greenhouse plants not in flower themselves, the heads of blooms showing just above these—and all Roses are appreciated in the spring time, even should the heads of the plants not have arrived at large size, or be very symmetrical in shape.

The plants come in for the same kind of uses as those raised from budded stocks in the ordinary way, only they are one year in advance of what those would otherwise be, and the blooms they throw are of use at a season when Roses are not plentiful. In May and June the bulk of the plants were turned out of their pots into good soil, in a sunny part of the kitchen garden, and securely staked, care being taken to have stakes long enough to go through the heads, and to which the chief branches were loosely secured with bast, otherwise the winds would play havoc with them. The next year the plants were of sufficient size to be employed in filling vacant spaces in, or making new beds of Roses. Grafted Roses are in all points as good and as enduring as budded ones.

Root-grafting was not much practised formerly, for seedling Briars, Manetti, polyantha, and La Grifferaie Roses as stocks were unknown; and we do not seem to have got much more forward by their use—at least, the private gardener has not done so; although their introduction has enabled the trade to meet the immense demand for Roses, which it could not have done in Roses on aged Briar stocks, and on their own roots—that is, from cuttings. Here is a difference which the private grower ought not to lose sight of, viz., that what is suitable and proper for a nurseryman to employ is not equally so for him; and it is owing, perhaps, to the former not generally recognising this fact that the home propagation of many kinds of plants is but little followed in gardens.

VIEW IN THE GARDEN AT BOSAHAN (see Supplementary Illustration).—The view in the garden at Bosahan, Corwall, which we give in the present issue, shows how effectively the Pampas-grasses, with Bamboos and similar forms of vegetation, appear against a background of rich foliage. In due season colour may be obtained by the intermixture of Eremurus and Tritonia.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society will be held on Tuesday, March 24, in the Drill Hall, James Street, Victoria Street, Westminster, from 1 to 5 P.M., at which the committees will meet as usual. At 3 o'clock a lecture will be given by Mr. W. GIGLLEN, on "Saladings."

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Right Hon. the Earl of LATRIM, G.C.B., P.C. (the Lord Chamberlain), has kindly undertaken to preside at the fifty-seventh Anniversary Festival Dinner, in aid of the funds of the Gardeners' Royal Benevolent Institution, to be held on May 30, at the Hôtel Métropole.

THE ROYAL GARDENERS' ORPHAN FUND.—We learn that His Grace the Duke of BEDFORD has kindly consented to take the chair at the Annual Festival Dinner on Thursday, June 18.

HORTICULTURAL CLUB.—The monthly dinner and *conversazione* took place on Tuesday evening, the 10th inst., at the rooms of the Club, Hotel Windsor; the chair was occupied by Sir J. T. D. LEWELLYN, Bart., M.P., and Mr. W. T. THISELTON DYER was the special guest of the Club. There was a large attendance of members and friends, including Mr. Alderman Skewes-Cox, M.P., the Rev. W. Wilks, Messrs. H. J. Veitch, II. Herbat, James H. Veitch, E. J. Cockett, H. J. Pearson, C. E. Pearson, A. H. Pearson, George Paul, George Nicholson, A. F. Barron, George Buyard, Harry Turner, F. Rivers, R. Johnson, and the Secretary. The health of Mr. Dyer was proposed by the chairman, as was also that of Mr. Skewes-Cox, and the other visitors, and both were suitably acknowledged. Mr. George Paul then read an able and interesting paper on "The Resurrection of the Older Sorts of Roses," which gave rise to a lively discussion, in which many interesting facts were elicited. The *conversazione* was closed by a few remarks from the chairman, who thanked Mr. Harry Veitch for the beautiful flowers with which the table was decorated, and Mr. Rivers for some English-grown Oranges. The dinner altogether was a great success. We hope to publish Mr. George Paul's paper in a future issue.

FRENCH ROSE SOCIETY.—According to *Le Jardin* for March 5, the Rosériste section of the Société Nationale d'Horticulture de France decided, during the *séance* held on February 13 last, that its staff should be constituted as follows:—President, M. Léon Simon; Vice-Presidents, MM. Leveque and Scipion-Cochet; Secretary, M. Pierre Cochet; Vice-secretary, M. Rothberg; Delegate to the Council, M. Dany. This section will organise, at Paris, during the grand horticultural exhibition in May, a special Rose Congress; a little later, about July 10, they will hold, in the rooms of the Société Nationale d'Horticulture, Rue de Grenelle, a Rose show, which, doubtless, will attract many admirers. Further, the Société Nationale des Roséristes Français, on the occasion of their Assemblée Générale on February 17, elected a provisional committee, composed of the following members:—President, M. le Comte de Bonchard; Vice-president, M. Pierre Guillot; Secretary, M. Octave Meyran; Treasurer, M. Bernaix fils; Members, MM. A. Bernaix, Bonnaire, Brechon, Charreton, Croilier, Dabrenil, Gamon, Griffon, Jacquier fils, Laparrières, Pernet-Duchet, and Praelier.

ST. MARY, WHITECHAPEL, HORTICULTURAL SOCIETY.—This urban Society, which exists for the purpose of fostering a love of plants amongst the children attending the schools of this parish, and which, in this connection, holds shows, distributes seeds and plants, and is affiliated with the People's Palace and East London Horticultural Society, is extending its useful work, and, as a matter of course, its expenditure likewise. We have before us a statement of its modest financial position, which shows an income for the year of £25 0s. 9½d., and a total expenditure of £24 19s. 0½d. Mr. FRED. PEARY, Hon. Secretary, 4, Camden Terrace, Ilford, is urgent in his appeals for further assistance, which doubtless some of the readers of the *Gardeners' Chronicle* will gladly accord him.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the General Committee took place at Anderton's Hotel, Fleet Street, on March 16, which was largely attended, Mr. B. WYNNE presiding.

A VIEW IN THE GARDEN OF A. PENDARVES VIVIAN, ESQ., ROSAHAN, CORNWALL.

Letters were read from Sir E. Saunders, thanking the members for his re-election as President; and from Mr. Harry J. Veitch, also thanking the members for his election as a Vice-President. A vacancy having occurred on the General Committee since the annual general meeting on the 24th ult., Mr. J. Walker, of Paddington, was unanimously selected to fill the vacancy. As it is usual at this period of the year for six members of the Floral Committee to retire by rotation, but who are eligible for re-election, the result of the poll showed that Messrs. George Gordon, H. J. Jones, C. Gibson, and E. Rowbottom were re-elected; and Mr. Norman Davis and Mr. J. Lyne, elected in the places of Messrs. W. H. Fowler and J. H. McHattie. Mr. Thomas Bevan was unanimously re-elected Chairman of the Floral Committee for the ensuing year. The Chairman made a statement setting forth what had been done by the Jubilee Committee, and laid upon the table the two schedules of prizes to be offered at the two exhibitions to be held in November next. It was reported that the Special Jubilee Fund had reached the sum of £240, in addition to special prizes, cups, &c., amounting to a similar sum; the Chairman stating that further donations were necessary to enable the Jubilee Committee to fully carry out their original programme; and also announced that the Jubilee Banquet would take place at the Hôtel Métropole on November 3, and a Conference Meeting on the opening day of the second show, viz., November 5. It was resolved that a certain sum be transferred from the general account to make the Reserve Fund up to £100, and that this sum be put on deposit at the bank. Nine new members were elected, and four societies admitted to affiliation. Heartly votes of thanks were passed to the Chairman and Secretary for their services in connection with the Jubilee Celebration. The prospects of the Society never looked brighter than at the present time; but further contributions to the special Jubilee Fund are earnestly desired, to enable the programme to be carried out in all its entirety.

**THE NATIONAL VIOLA SOCIETY.**—A large gathering of Viola enthusiasts was held in the Guildhall Tavern, E.C., on Tuesday, the 17th inst., when a resolution passed at a recent meeting of the members of the London Pansy and Violet Society, that they incorporate themselves under the broader title of the National Viola Society was unanimously carried into effect. With Mr. Wm. Robinson, F.L.S., as president; Dr. Shackleton, of Sydenham, chairman of the committee; Mr. H. A. Needs, of Woking, hon. treasurer; Mr. Richard Dean, of Ealing, superintendent of exhibitions; Mr. A. J. Rowberry, of Woodford, hon. secretary; and a strong committee of amateur and trade growers, the remodelled society should meet with success. Under the general trade title of Viola, tufted, show, and fancy Pansies, as well as all the other types of the genus, will be encouraged. It is proposed to hold one or more exhibitions, with a Viola conference during the forthcoming summer in the gardens of the Royal Botanic Society, Regent's Park, N.W., the Council of the latter society having kindly offered accommodation, with facilities for a practical trial of plants in the society's gardens. A Floral Committee will be appointed to sit periodically during the season to adjudicate upon the merits of seedlings or sports that may be submitted to them, with a view to certificates being granted, particulars of which, together with the schedules of the society, will be issued at an early date. The hon. secretary, Mr. A. J. Rowberry, of the Crescent, South Woodford, Essex, will receive the names of ladies or gentlemen desirous of joining the society, by which means they will assist in the advancement of the cultivation of this class of beautiful flowers, the development of which has recently made such rapid bounds. The annual subscription is 5s., which will include all entries, with free admission to the exhibitions and conference.

**SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.**—The second annual general meeting

was held on the 16th inst. at the Parish Room, Shirley, Southampton; the members mustered in good numbers, and the president, Mr. W. F. G. SPRANGER, C.C., presided. The report read, showed a steady progress, there being 140 members against 111 last year. Fifteen meetings had been held during the past year, the average attendance being fifty-two. The balance to the credit of the society was £1 16s., not including some unpaid subscriptions, which, however, are not yet despaired of. The retiring officers were all re-elected, and there was a very hearty vote of thanks to the horticultural and local press for the admirable and lengthened reports given of the meetings unanimously passed, as was a vote to the chairman of the evening's business. The business now over, the public were admitted to an entertainment, consisting of songs, recitations, &c., kindly given by members and some outside friends, and a very enjoyable two hours was spent.

**PETERSHAM MEADOWS.**—The bill promoted by the Dyart trustees, and which if carried, would seriously have injured the view from Richmond Terrace, was rejected by the House of Commons on Thursday last by 262 to 118.

**THE NATIONAL TESTIMONIAL TO MR. BARRON.**—We are requested to state that the general committee, which was formed to promote this testimonial, will meet at the Hotel Windsor, Victoria Street, S.W., on Tuesday next, at 2.30 P.M., to make arrangements for the presentation.

**EUCHARIS.**—Mr. ERNST KRELAGE publishes in the *Tijdschrift voor Tuinbouw*, a monograph of the species of Eucharis, with an illustrative plate. May we suggest to our Dutch friends the desirability of adding to their memoirs a summary or abstract in French or English.

**THE NURSERYMEN'S, MARKET GARDENERS', AND GENERAL HAILSTORM INSURANCE CORPORATION.**—The first ordinary general meeting was held at SIMPSON'S, 101, Strand, on Friday. In a subsequent number we shall allude at greater length to the satisfactory progress of this useful society.

**CONIFERS.**—A "hand-list" of the species and varieties grown at Kew out-of-doors and under glass, has just been issued. It is prefaced by an interesting historical introduction by Sir JOSEPH HOOKER, and by some extracts from the late JOHN SMITH'S records of Kew. The list is arranged according to the most recent method of grouping, is interleaved, and is provided with a full index, so that its value to the cultivators of this important class of plants will be great. The list is sold for 3d. at the Royal Gardens.

**THE SURVEYORS' INSTITUTION.**—The next ordinary general meeting will be held on Monday, March 16, 1896, when a paper will be read by Mr. ARTHUR C. PAIN, Associate, on the "Light Railway Bill, 1896." The chair to be taken at 8 o'clock. All inquiries with reference to the junior meetings should be addressed to Mr. A. NORMAN GARRARD, 8, Frederick's Place, Old Jewry, E.C.

**PROFESSOR MARMADUKE LAWSON.**—It is with great regret that we announce the death on February 14, of Prof. LAWSON, the Director-General of the Government Cinchona Plantations, Madras. On the death of Prof. DUBREY, Professor LAWSON occupied the chair of botany in the University of Oxford, a position he vacated on going to India. Prof. LAWSON was a contributor to *Hooker's Flora of British India*, and devoted himself at one time to the study of Mooses.

**READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.**—Mr. T. NEVE, chairman of the above association, presided over a largely attended meeting on Monday evening, 9th inst., to hear a paper on "Some Little-grown but Meritorious Hardy Flowers," by Mr. FRANK TUFNAIL, of Messrs. SUTTON & SONS' flower-seed department, which proved to be of a very interesting character. Mr. TUFNAIL began by saying, that in selecting this subject for the members' consideration and discussion,

it was not his intention to give a list of plants that were going to revolutionise the present flower-garden and displace well-known favourites, but rather bring to their notice some little known, or rather little grown, hardy flowers, deserving of equal favour and culture. Some are of recent introduction, others are kinds which once graced the gardens of our forefathers, and were banished by carpet-bedding. Many of the species are especially good for cutting and table decoration, others are re-chosen because of their adaptability for certain situations and seasons. After affording some hints on the cultivation of hardy perennials and annuals, the lecturer proceeded to deal with the descriptions and names among others of the following. Hardy perennials: *Achillea eupatoria*, *Ranunculus aconitifolius* fl. pl., *Papaver alpinum*, *Commelina coelestis*, *Armeria formosa*, *Chelone barbata*, *Coreopsis grandiflora*, *Eryngium alpinum*, *Eryngium giganteum*, *Agrostemma coronaria*, *Calandrinia umbellata*, *Gypsophila paniculata*, *Iberis Fruiti*, *Lychnis chalcidionica*, *Oonitis rotundifolia*. Hardy annuals: *Phacelia campanularia*, *Gypsophila elegans*, *Larkspur*, stock-flowered rosy scarlet, *Lavatera rosea splendens*, *Linaria reticulata anreo-purpurea*. The lecturer concluded by advising those present to grow a dozen of the species he had mentioned, as he felt sure they would be more than pleased with the result. A lengthy discussion took place on the various plants brought before their notice. Various flowers were staged by Messrs. TUFNAIL, ALEXANDER, and TOWNSEND, bunches of Sutton's Earliest of All Wallflower attracting much attention.

**"JAMAICA BULLETIN."**—We have received the January part of the *Bulletin of the Botanical Department, Jamaica*, which contains, among other matter, "Notes on the Orange, giving Hints on Pruning and Dressing;" "Coccidias or Scale Insects," by T. D. A. COCKERELL; "Notes on Kola, Orria Root, the Use of Eucalyptus Oil in Yellow Fever;" and "Synoptical List of Ferns" (continued).

**THE MIDLAND CARNATION AND PICOTEE SOCIETY.**—The fifth Report shows that this society continues to maintain and improve its position, new members filling the places of those removed by death and other causes. The exhibition held at Edgbaston on July 31 and August 1 last year was an improvement on any previous one, but the season being an early one, southern growers were less to the fore than usual. Many honorary exhibits were made, and the display generally was much admired. In 1895, the donations and subscriptions amounted to £136 17s.; special prizes to £22 9s. The outlay, inclusive of a donation of 5 guineas to the Gardeners' Royal Benevolent Institution, amounted to £192 7s. 7d., and the income to a sum of £232 9s. 10d.

**CHESHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—The usual fortnightly meeting of this Society was held on Thursday, March 12, at Turnford, Mr. W. HARISON presiding, and Mr. J. H. DEAN contributing an interesting paper on "Pears as a Market Product, and Grown under Glass." With regard to the style of houses, he suggested that they should have the appearance of ordinary span-roofed vineries, say, 220 feet long by 28 feet wide, with ventilating lights reaching from the ridge to the gutter-plate (instead of the small top-lights now in ordinary use), and that they should be fitted with Harris's patent light-lifting gear, and fixed at the lowest point of the roof, as an abundance of air will at most times be essential. A moderate supply of hot-water piping, to enable the fruit to be ripened in cold seasons, and to preserve the fruits of late varieties, and also to aid in starting trees for an early supply if required. Then erect in line, 3½ feet from outside wall, suitable deal battens, 1½ by 2 inches, 3 by 3 inches at each end, fixing all firmly to the sash-bars and base of house. The lecturer went on to describe the operation of stretching galvanised wire, and the preparation of the border. He recommended planting the trees 4 feet apart close to the trellis, planting 1-year

old cut back bushes worked on the Quince stock, and left unpruned 1 year previous to planting, the unpruned wood thereby becoming fruiting wood, and capable of bearing the first season. Mr. DEAN closed his lecture with a few remarks on two probable diseases that would occur under this mode of treatment, namely, green-fly and canker. The next meeting will be held in St. Mary's Hall, Cheshunt, when Mr. JAMES HUDSON, of Gunnersbury House Gardens, will deliver a lecture on "Stove and Green-house Climbing Plants." NIEL MACKENZIE, Esq., will preside.

**NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.**—The monthly meeting of this Society, held on Tuesday, March 10, at their Room, 25, Westgate Road Newcastle, was well attended by members, and Mr. JOHN BOLLOCK occupied the chair. A varied collection of choice blooms was on the table, including Rhododendrons, Dendrobiums, Narcissus, Tulips, and others. There were ten new members proposed; after which Mr. HENRY INNES, Leeze Park, read a paper on "The Yeast Plant," illustrating the development and functions of the vegetable-cell by the aid of black-board drawings, which added much to the interest of the subject.

**PRIMULA "SNOWDON."**—Mr. WILLIAM BULL has submitted for our inspection flowers of a new form of the fimbriate section of Chinese Primrose. The flowers are of excellent quality, exceeding 2 inches in diameter, deep, solid in texture, dead white, with a pale-yellow eye. The habit is said to be good. It is, no doubt, an excellent variety.

**PUBLICATIONS RECEIVED.**—*The Tomato, and How to Grow it for Profit*, by JOHN COBBAN, Rotherham.—*Fruit-Growers' Year-Book*. Edited under the direction of the Earl of WINCHELSEA. (Cable Office, 30, Fleet Street, E.C.; and in several towns in England, Scotland, and Ireland, and Jersey and Guernsey.)—*One and All Gardening*, edited by E. O. GREENING.

### PLANT PORTRAITS.

**ERANTHUS GRANDIFLORA.** *Orchid Album*, vol. xi., pt. 129.  
**LYRIBEPHYLLUM GUAYANENSE.**—A cross between *C. Stonei* and *C. Spicerianum*. *Revue de l'Horticulture Belge*, March 1.  
**DICENTRA CUCULLARIA.** *Meehans' Monthly*, March.  
**NOLINA RECURVATA.** *Garden and Forest*, March 4.  
**PHYSALIS FRANCHETI.** *Revue de l'Horticulture Belge*, March.  
**RENANHERA STORIELI.** *Orchid Album*, vol. xi., pt. 129.  
**SONERILA MADAME PAUL DU SOIET.**—A cross between *S. orientalis* and *S. margaritacea*. Leaves green, thickly bestrewn with white spots. *Illustration Horticole*, t. 52.

### NOTICES OF BOOKS.

**INSECT LIFE:** a short account of the classification and habits of insects. By F. V. Theobald. (Methuen & Co., 36, Essex Street, London.)

This is a carefully-compiled introduction to the knowledge of insects, which may be recommended to those who wish to gain a general knowledge of the subject, and especially to teachers and others engaged in agricultural and horticultural colleges. It is a little too advanced to put into the hands of a novice, but a student who has already some little knowledge of general physiology will find the book very helpful. It details the structure, embryology, and life-history of insects, and explains the modes of classification usually adopted. A chapter on the use of insecticides is added, in which the virtue of prevention is strongly and most appropriately urged. The methods of spraying fruit-trees with Paris Green and similar substances are explained. A bibliography and an index complete the volume, which is well illustrated, and should have a place in every cultivator's library.

**BEETON'S NEW DICTIONARY OF EVERY-DAY GARDENING ETC.** Entirely new edition, with 550 illustrations. (Ward, Lock & Bowden.)

There is a great deal of useful information to be gleaned from this volume, which is issued at a low

price, and therefore does not compete with other more carefully-compiled works of a similar class. This edition is stated to be "completely re-written and thoroughly revised," but obviously much further revision and correction are desirable in certain articles. Very good are those portions relating to allotment and kitchen gardening. The monthly calendar may also confidently be recommended—and, indeed, all the portions devoted to practical gardening.

### HAND-LIST OF ORCHIDS CULTIVATED IN THE ROYAL GARDENS, KEW.\*

It is not within the scope of the ordinary observer, although he may frequently be a visitor at the Royal Gardens, Kew, to form even an approximate idea of the extent of the wonderful collection of plants there, or of the labour, the skill, and energy, which must necessarily be shown by the Director and the staff, in order to preserve the botanical essentials of the vast establishment, and yet to make that interesting and often gorgeous display of flowers in each department generally here to be seen, but which the casual observer too often regards as "a matter of course," and the inevitable out-come of the resources of the gardens. In like manner even the professional gardener, probably frequently makes the tour of the place, regarding it as a garden pure and simple, and without for a moment considering that the gardening part of the question is the least difficult to deal with, while the partially concealed scientific work which the indefatigable Director causes to ramify from Kew to the uttermost parts of the earth—work done both by brain and hand—makes it a true botanic garden and centre of British and Colonial gardens, of which the nation may be proud. Even the specialist fails to grasp the completeness of the collection of plants in his own particular branch. Few Orchidists, for instance, will be prepared for the evidence of the very numerous genera and species of Orchids which Kew possesses.

The list to which we have already briefly referred, enumerates some 200 genera and 1800 species, and is arranged in the simplest manner possible, the name in each case being followed by the authority, the country from which the plant comes, and where possible a reference to a figure. The principal synonyms of each are also given in alphabetical order with reference to the proper name. In every respect the list is well-arranged, so as not only to be a reference to the plants cultivated in the gardens, but also to be of service to every gardener or amateur interested in Orchids, and into the hands of the majority of which it will doubtless find its way, the few pence which it costs placing it well within the reach of every lad employed in gardening. The showy and the botanical species in the gardens seem fairly balanced, for while there is a tolerably complete set of such showy things as *Cattleyas*, *Lælias*, *Odontoglossums*, &c., which are commonly met with in private collections there are surprising collections of some of the botanical species usually regarded as curiosities, and always regarded with much interest and admiration, even by those who profess to care for none but those with showy flowers. Thus, perhaps, for the first time in the history of Orchid culture, does an enumeration of over sixty species of *Bolbophyllum*, thirty species of *Cirrhopetalum*, and a like number of *Catasetum* appear as being cultivated in any garden; and so on with other genera which are rarely represented in gardens. In the list, too, it is noticeable that some of the plants received with garden names and not yet proved, are treated with proper toleration, their names being enumerated with "Hort." attached; and in some instances, the Orchid-grower will be pleased to see that certain names which he has always considered "botanical crotchets," appear in what he regards as their proper places. For example,

*Oncidium splendendum* takes its proper specific rank; and the true *O. tigrinum*, var. *splendendum*, in italics, refers it back to *O. splendendum*. Whatever pretence the examination of dried specimens of *O. splendendum* might give for placing it under *O. tigrinum*, it is very clear that those who know the living plants, also know that there is practically no resemblance. So also in the enumeration of the *Odontoglossum* the gardener will be pleased to see that his plan of keeping *O. Andersonianum* distinct, instead of huddling it with an incongruous lot under *O. crispum*, which it and others often placed under it, certainly will not fit. This useful *Hand-list* will come as a surprise and a pleasure to all who are interested in Orchids, and who will, apart from the help the list will give them be glad to learn by it that our great Botanical Gardens at Kew are fulfilling their proper functions towards the now favourite class of plants coming under the common denomination of Orchids. The *List* is to be obtained at the Gardens, price 6d.

### COFFEE IN CENTRAL AFRICA.

IN 1878 I was appointed by the Church of Scotland Foreign Mission Committee to proceed to Blantyre, East Africa. Before leaving, the foreman (now Curator, and a friend of my own) of the Royal Botanic Gardens, Edinburgh, gave me the first Coffee plants, which I tended carefully on the way out, and, with the same care, they were planted in the Mission garden.

In the year 1880 we had a small crop on the parent tree, about 1000 beans in parchment, which were all sown. Four hundred of the seedlings were planted in the Blantyre Coffee-garden in February, 1881. In 1883, off the 400 trees, 1½ cwt. of Coffee were gathered. I may mention the size of the pits was 6 feet wide by 3 feet deep; they were filled up with alluvial soil, cow manure, and wood ashes. I believe this accounts for the enormous crop.

The last crop which I pulled off the mother tree, after being pulped, washed and dried, weighed ¾ lb., and I am certain that the Coffee culture in some parts of British Central Africa will turn out as well as in any other Coffee-growing country in the world, if well attended to.

The late Mr. Henry Henderson, of the Blantyre Mission, brought from home in 1879, 56 lb. Liberian Coffee seed which I had the pleasure of sowing. Only seven grew to maturity; one was sent to Zomba, another to Mandala, the rest were planted in the Mission garden. They took nine years to bear fruit; the bean seemed to be sound and of good quality, but little has been done with this variety. Blue Mountain and Orange Coffee were introduced by Mr. John Moir or his brother while joint managers at Mandala, but I cannot give the year of its introduction. The Blue Mountain, as far as my experience goes, is well suited for high elevations in the Shire Highlands. The Orange Coffee is more tender, and perhaps better suited to lower elevations; at the same time, I have taken a good crop off the few plants which I have. As to the quality of the Coffee I cannot give any opinion, nor as to its origin. *Jonathan Duncan*, in "The Central African Planter."

### COLONIAL NOTES.

#### L A G O S.

THE annual report of the Botanic Station, of which Mr. H. Millen is curator, shows that good progress is being made in the introduction, culture, and distribution of tropical economic plants. Among European introductions, Cucumbers, Radishes, Beans, Turnips, Beetroot, and Kohl Rabi have done exceedingly well. Rubber plants generally thrive, such as *Manihot Glaziovii*, or Ceara rubber, and *Castilloa elastica*. Hevea Spruceana has not been so successful, but *Ficus elastica* does well. Liberian Coffee is largely planted. *Eucalyptus* and *Casuarina*, which do not succeed in other west African colonies, have been successfully established at Lagos.

\* *Hand-list of Orchids Cultivated in the Royal Gardens.* (London: Printed for Her Majesty's Stationery Office by Eyre & Spottiswoode. 1896.)

FIG. 50.—ZYGOPETALUM FERRENONDI.

(Colours, olive green and brown, with lip of rich violet; the flowers of natural size.)

## ZYGOPETALUM × PERRENONDI.

THE illustration (fig. 50) shows a very beautiful cross out of *Z. intermedium* × *Z. maxillare* Gautieri, which was shown at the Royal Horticultural Society's meeting on the 10th inst. by M. A. A. Pecters, of St. Gilles, Brussels, and which received an Award of Merit. The sepals and petals are of an olive-green tint, with bars of brown, and the relatively large lip—the most conspicuous part of the bloom—is of a rich violet colour.

## EUPATORIUMS.

FEW plants are more useful for winter or spring decoration than the Eupatoriums, and although gardeners, with large houses to fill, grow them largely, they are not much grown in small gardens. The plants do not require much heat. Several varieties are very suitable for decorative purposes, and for cutting; few plants are more valuable when grown in a cool greenhouse. The flowers are not showy, but come at a dull season, and in tolerable abundance. Some Eupatoriums may be grown in the warm-house, but do just as well in a cool one. Those which are known in gardens under the name of Hebeclinium are usually grown warm, but even these do well in the open air in the summer months, when they have filled their pots with roots.

I will note chiefly those which succeed under cool treatment, taking *E. riparium* first, although it can be made to produce its blooms in the warm-house with no more injury than a certain softness and want of durability in the flowers so obtained. To get the finest blooms, plants should be propagated yearly, and very good ones can be obtained in twelve months from the time of striking the cuttings. The plants also seed freely, especially *E. riparium*, if the plant is stood on the ground when in bloom; but the cuttings striking readily, there is little reason to employ seed. To obtain good size, and afford more time for the plants to grow, cuttings are taken from plants when they are cut down after blooming, if possible selecting the shoots which spring from the roots and have not flowered. These are struck in the early autumn, and given a shift into 48-sized flower-pots before the winter sets in, and afterwards kept in cold frames from which frost is kept out. About the middle of the month of February these plants are slightly pruned, and when broken they are repotted into 6-inch pots, and by the middle of May they are ready for their final shift, that is, into 8-inch or larger pots, if they are to be grown of a very large size. By raising plants in this manner there is no need to retain the old plants, which may be thrown away as soon as flowering is past. The young stock of plants is plunged in coal-ashes or Coco-fibre out-of-doors during the summer months, and liberally supplied with liquid-manure and clear water, especially when the pots become filled with roots, and every sunny afternoon watered overhead as the sun declines. Any neglect in watering is sure to be followed by loss of the lower leaves, which is a disfigurement. Old plants, if kept, are rather troublesome, needing much greater quantities of water, and they make a great number of small shoots which do not flower. If small plants for the fronts of stages are required, these may be raised in this month, and grown on till they come into 6-inch pots. These small plants are of service in filling vases for forming groups in apartments, &c.

For market purposes, Eupatoriums are less suitable, and I believe their usefulness is mostly as pot plants, and for cutting for home uses. *E. riparium* and *E. Weinmannianum* are pretty objects in vases, being light and graceful; and when grown cool they last for a long time. *E. odoratum* is a free grower, and blooms freely late in the autumn, and lasts a long time in bloom; and if the plant is well stopped, it makes a very fine bush. The three varieties I have named are about the best of the winter and spring bloomers, and as the blooms appear in quantity from October to April, they are among the most valuable. *E. ageratoides*, a free-flowering variety, of less height than those, much-branched, and quite hardy in most parts of the kingdom, is also effective as a pot-plant.

The Hebecliniums are so good for spring decoration they should be included, especially as they are known as Eupatorium ianthinum and E. atrovirens. These, if afforded greenhouse treatment, make fine decorative plants for use in March and April. They were formerly known as Hebecliniums, but are now put under Eupatorium. These should be raised from cuttings inserted in a sandy soil in a temperature of 65° to 70°, and they are best when taken after the plants have flowered—although it is a gain in point of time to take the young shoots at any season. E. atrovirens is the better of the two; the flowers are of a bluish-lilac tint, produced in large trusses, and the leaves are of a deep green hue, and large size. E. ianthinum, an older introduction, has purplish-coloured flowers, borne in terminal corymbs, and deeply serrated leaves, of good size. These two species may be grown on if desired year after year; if cut back and potted annually, making large specimens. When cut back it is necessary to keep them somewhat dry at the root, and then partially shake them out and re-pot in three-quarters loam, one-quarter leaf-mould, with some dry cow-manure or spent Mushroom-bed manure finely sifted. The potting must be firm. At first, afford them a frame, with plenty of water at the root as the growth progresses, and from June to September stand them in a sunny spot in the open air.

The other varieties named should be grown in good fibrous loam, with dried cow-dung or other manure, very light or porous soils being avoided. If labour is not abundant, the plants may be planted out in good ground, and lifted and potted early in the month of September, taking care to have a good ball with each plant. E. riparium and E. Weinmannianum do well when lifted from the open ground and planted in frames, two crops of blooms being obtained in this way. When grown cool, Eupatoriums require no stakes to support them if they have been stopped twice when growing. Insects do not infest the plants to any extent, unless it be red-spider in very dry summers. *G. Wythes.*

## HOME CORRESPONDENCE.

**PROTECTING FRUITS FROM BIRDS.**—Those of us who are located in woody districts, and who attempt to grow any of the hardy fruits of which birds are fond, have always to protect them. Compositions of lime, soot, &c., commonly used for making buds distasteful to the bullfinch and sparrow, are helpful, but not always effectual, while the ordinary herring-netting, if properly secured (which is sometimes very difficult), is, perhaps, the most satisfactory for such crops as Strawberries, which last for short seasons only. In the fruit garden here a means of protection has been adopted, of which perhaps a description will be interesting, although the contrivance is by no means new. A similar means has, I believe, been recommended by Mr. Iggulden. It consists of a framework of galvanised iron 8 feet in height, covered with 3-inch mesh galvanised wire-netting, constructed in the following manner: The framework of the sides is formed of a series of strong hurdles made of iron bars 1½-inch by ½-inch, securely bolted together, while the covering is made of iron transverse bars 1½-inch by ½-inch, forming 6-foot squares, and supported by 1½-inch iron pipes placed 12 feet apart, which rest upon iron plates 18 inches beneath the surface of the ground, and carry socketed caps, to which the bars are strained, and firmly secured. The netting is laced to the framework, and on the sides which form a portion of the boundary of the garden, about 1 foot of netting is pegged to the ground as guard against rabbits. Closely-fitting gates or doors are placed at the entrance to each walk, which are opened during seasons when birds are harmless. The occupants of this enclosure are Cherries, Plums, Pears, Raspberries, Currants, and Gooseberries. Its sides are furnished with cordon trees, and it answers its purpose admirably; it has not, however, escaped criticism. First, it was said, that owing to the exclusion of birds, the trees would be ruined by insects. These have, so far, proved to be no more troublesome than they were previously. Secondly, the trees, it was said, would receive injury from the galvanised covering; it was thought, pos-

sibly, that in some way galvanic action would take place. Thirdly, a fear was expressed that injury would result from excessive radiation of heat, from the action of the iron. As no apparent injury has been sustained by the cordon trees, which are actually in contact with the galvanised metal, and as some of the trees planted under the covering two years ago have already been root-pruned, in order to check their strong growth, while Raspberry-canoe have grown through the top, I think there need be no alarm on these points. In the erection of protectors of this description, they must be made sufficiently strong to resist a weight of snow; but it is advisable to shake a heavy fall from them, and thus relieve them of an unnecessary strain. *Thos. Coomber, Hendre Gardens, Mon.*

**ORCHID GROWING BY THE ARTIZAN.**—What a marvellous advance has been made in the growing of Orchids in this country since the enormous importations has reduced their value to the price of Pelargoniums and Fuchsias! In almost every town or borough district there are a few of the "horny-handed sons of toil" that take to their cultivation. This last week the writer has seen two collections growing under exceptional circumstances. The one was owned by John Hampson, Whitefield, a shoemaker; the other by Edward Wolfenden, Radcliffe, a stonemason. The only access to the former's glass-house was through the workshop—where "John" was toiling away making clogs, so much need by workmen in the manufacturing districts of Lancashire—then through the back kitchen, and into a yard, where the small semi-span house was completely filled with a variety of Orchids, some doing well. The house was heated with hot-water, and it was quite pleasing to see some nicely-grown pieces of Dendrobium Wardianum in flower, and in one or two very good varieties. Dendrobium appear to be the favourite flowers with both rich and poor, and little wonder there is such a variety among them, as the flowers are lasting. Along with these were some Cattleyas, and Odontoglossum Rossi at the one end, which has been very cheap of late, flowering profusely. There was a nondescript lot, huddled together without any semblance of order, the desire being more to get the flowers. It was a small house with a very narrow passage, but it shows really what may be done in a back-yard of a small tenement. Edward Wolfenden, the stonemason, has got a bit of ground opposite his modest-looking tenement, and he has erected a house divided into two compartments, and out of his modest earnings he has saved enough to get up a very nice collection. He began buying cheap plants, but he has gone on, and is now dispensing with his common plants, and getting some of the better articles. As he said, we must "creep before we walk;" every penny he can spare in a fair way goes to the purchase of Orchids. I was surprised to see, for instance, nice lots of Cypripedium Lesanum giganteum in fine flower, and one of the best, too; and also the Stand Hall variety of Dendrobium splendidissimum grandiflorum, as well as such good things as D. Cooksoni and D. Ainsworthii. In the cooler division were an excellently-grown lot of Odontoglossum crispum and plants of that order. One would like to see the plants more orderly arranged; however, they were clean and free from insects. These men read Orchid literature greedily, but they have generally a mind of their own; and although they are in some measure guided by a Calendar of Operations, each has his own way with particular favourites. *J. A.*

**LARCH DISEASE.**—It is interesting to know that Sir C. W. Strickland has both the Japanese and black American Larches under cultivation, and it is to be hoped that later on he will let us know how the latter has succeeded, it being considered by many persons a tree that is well worth trying for profitable planting in this country. An official connected with the Canadian Pacific Railway writes to me that the timber is of excellent quality, and largely employed for railway and other purposes. Referring to the Larch disease, it is impossible to say on what it depends, healthy trees up to forty years old, and growing on almost every conceivable soil, and at various altitudes, having suffered alike throughout Great Britain. It has been asserted that trees growing in low and damp situations suffer most; but such is not the case, as I have repeatedly noticed in many parts of the country. Probably nowhere is the disease worse than on the dry sandy lands of parts of Bedfordshire, as witness some of the woods between Bletchley and Woburn; while on chalky upland ground at Colesborne, Gloucestershire, it is

equally bad. I have just returned from reporting on some plantations in the Midlands, and there on dry chalky ground the Larch is suffering in a wholesale manner from the disease; while several large plantations in South Wales have required to be re-planted, owing to the widespread destruction of the Larch by disease, the soil being a light, rich loam. My own opinion is, that neither soil nor site have much to do with the spread of the disease. I noticed last week that in a large Larch plantation nearly three-fourths of the trees had recovered from the disease, and this is some consolation, though the timber of trees that have been affected can never be of much value. It is wrong to say that the Larch disease is well known in Ireland, for such is not the case—at least, that I have heard of. With the kind co-operation of the editor of the *Irish Farmers' Gazette*, I have many letters in my possession from landowners in different parts of Ireland, one and all of whom positively state that the Larch disease is unknown in their woods. *A. D. Webster, Bawnmoor, Herts.* [We have further evidence on this subject which we shall print next week. Ed.]

**IRIS RETICULATA.**—One of the most beautiful of all hardy flowers is *Iris reticulata*, of which I have some bulbs planted on west and east borders. Those on the former began to flower early in February, and were followed by those on the latter, on which today, March 11, I have 150 flowers in all, open. The flowers are very fragrant, deep violet and lustrous yellow in colour. *J. Slow, Wilts.*

**THE FRUITS OF PYRUS SORBUS.**—I have read with interest your note on Count de Murard's fine specimen of *Pyrus Sorbus* (*Sorbus domestica* of other botanists), and of the uses made on the Continent of its fruits; but I note that you do not mention the fact that the fruit is eaten in the raw state when "bletted"—like a Medlar. It is in this state that it may be made into jelly, just as the Medlar may be used. *Françoise.*

**GARDENERS AND STEAM-ENGINES.**—I would point out to "Hortus" that it is never safe to sneer at things one does not understand. More especially is this true in respect to art matters. For instance, had he said nothing about "garden designers and other faddists," I should have been willing to admit that he was able to appreciate the spirit of garden design—now I know that for him a garden in its fullest and best sense does not exist; therefore I should not be in the least surprised at any act of vandalism which he might commit in it. That is rather a good, original, and philanthropic idea which "Hortus" brings about gardeners helping their employers these hard times; but perhaps a still better plan would be to reduce the size of the gardens—many of them could be reduced with advantage. In my first letter I tried to impress on gardeners the importance of keeping their position as craftsmen, one of the most honourable positions any man can fill. At the same time, I endeavoured to point out that a garden was the one thing left to us which need not and ought not to be commercialised; but "Hortus" and Mr. Don say, or at any rate imply, that we must march with these times of general progress—but in the matter of crafts we have been passing through a period of retrogression, and not progression. To such an extent is this true, that many people cannot distinguish between a steam joinery and a piece of genuine carpentry. They would as soon have a cast-iron entrance-gate as a wrought-iron one. To them, the man who turns the handle of the street-organ and the one who plays the anthems in church on Sunday are both equally musicians; and so the man who attends the steam-mower is to them just as much a cunning workman as the one who uses, as some men can still use, the scythe. Referring to the question of extravagance in the laying-out and maintenance of public parks, which is somewhat outside the question under discussion, their economy must always be judged in keeping with the amount of pleasure or instruction given. For instance, judged on this basis, a picture by a good and inventive artist might be cheap at £100, but a machine-print of the same picture might be dear at 5s.; and yet many people, of whom "Hortus" would probably be one, cannot see where the difference comes in. In conclusion, I have only to re-state my firm conviction that a garden is not the place for mechanical appliances, that they are antagonistic to the spirit of the thing, and that gardeners in countenancing them are lowering their prestige, if these steam, or any other mechanical appliances, have to be used. Confine them to cricket-grounds and other places generally under the management of municipal

scavenging departments, but do not bring them into our gardens or public parks. *Thomas H. Mawson, Windermere.*

**A DESIRABLE VEGETABLE.**—Some time ago I called attention to a very much neglected dainty vegetable, i.e., blanched sprouts from Swede-Turnips, and some of the correspondence which followed showed that very different opinions were entertained by people who had experimented with them. Since my original note was written, we have tried various experiments, and I think I can safely say that I have found the cause and remedy for the very irregular quality, and also how to grow the sprouts to the best advantage; and this being the time when they can be grown in any quantity without artificial heat, it is desirable that our experience should be noted as early as possible. The sprouts which form in the Turnip-heap, although used by farm labourers, are rank and strong, having nothing to recommend them, and we, for two years, grew them in a Mushroom-house, which was partly out of use. In this the atmosphere became most offensive, and although the sprouts were fairly good in flavour, and occasionally very good, the result was not everything which could be desired, and the crop, from ordinary closely-trimmed Turnips, was small. This year we have kept some Swedes untrimmed, and are now placing them close together in a box, the bottom of which is covered with a few inches of damp sand, the box being loosely covered by a mat. Under these conditions, we get a small forest of very fine shoots, perfect in flavour, free from objectionable "turnip" taste, and which we prefer to well-grown Seakale. Those who have no untrimmed Turnips, can easily test the quality and flavour, although the crop will be comparatively small. They will be able to judge as to the quality, and form an opinion as to the desirability of extended operations next year. My own opinion is, that the sprouts would be a first-rate and good selling vegetable for market purposes, fetching a good price, costing very little to produce, and would be a very powerful competitor to Seakale at a season when first-class vegetables are expensive. They can be obtained in any quantity, under the same conditions as forced Rhubarb, from Christmas; the only points necessary are absence of manure or strong-smelling soil, and as much ventilation as is possible without the admission of light. *Thos. Fletcher, Grappenhall, Cheshire.*

**THE TIMBER OF THUIA LOBBII (GIGANTEA).**—I am obliged to Mr. A. D. Webster for reminding me that the timber of this tree has been imported, but I referred to its importation on a commercial scale, which has, I believe, not yet taken place. *A. C. Forbes.*

**ALPINIA NUTANS.**—The notice and figure of this interesting stove plant in *Gardeners' Chronicle*, p. 301, will no doubt cause it to be grown more commonly in gardens than at present is the case. Allow me to point out that, independently of its flowering, the growths are useful for mixing with cut flowers, especially in winter, emitting when handled a delicious fragrance. It is known commonly as the "Cinnamon plant," in reference to the agreeable scent of its foliage. *C. Herrin, Dropmore.*

**SEED SOWING.**—Within the next few weeks, the sowing of seed will be a part of the gardener's duties, and in order to obtain success, much care and good management are required on his part. Many of the seeds are very small, and unless care be taken, failures are certain to occur. In the first place, where much seed-sowing has to be done, a quantity of new porous soil should be prepared; leaf-mould, not too much decayed, or cocoa-nut refuse, are capital ingredients to use. The loam should be light rather than heavy, and with it sweet and open peaty soil passed through a fine sieve, and sand should be mixed. No soured, used-up soil, or any in which insects are present, should be used. The seed-pans and pots should be clean and dry; if new, they should be steeped in water for a few minutes before using them, and the crocks should also be free from dirt. The sizes of pots may vary from 4 1/2's to 3 1/2's, and these should be filled to one-third their depth with drainage materials, the rougher portion at the bottom, and finishing off with small crocks, and finally, moss or siftings. The compost must be fairly moist; and in filling the pots and pans, at the least half an inch space should be left for covering the seed, and for watering purposes. The soil must be made moderately firm by hand-pressure, and the surface rendered smooth. When filled stand them on a level surface, and allow a

gentle watering through a very fine rose-can, using tepid water, and in about fifteen minutes the seed may be sown. Tuberoses *Begonias*, *Gloxinias*, and many of the very fine seeds should be scattered evenly on the surface of the soil, and pressed down with something that is clean and dry, taking care that the seeds do not "lick up;" afterwards sprinkle a little dry sand over them, but afford no water for some time. These seeds should be placed in a temperature of 60° to 65°, placing a square of glass over each pan or pot, and a piece of paper, which should remain till the seeds germinate, when the glass should be tilted up and the paper removed. Stand the seed-pans on a damp bottom, at a distance from the hot-water pipe, shading them from direct sunshine till the seedlings are strong enough to bear it. The pans and pots should be immersed to the rims in warm water, but the water should not overtop the soil, or the seed might get washed to the sides. If the house in which the seeds are placed is much syringed, the squares of glass should be replaced, or some other means taken to prevent water reaching them. When large enough to handle, no time should be lost in getting seedlings pricked off into other pans or boxes, or damping may occur and many be lost; a little dry sand sprinkled over the plantlets sometimes prevents damping to any great extent; with large seeds less care is required, for as a rule these seeds are buried deeper in the soil, and are not liable to be washed out. *H. Markham, Moreworth Castle.*

## BELGIUM.

### CHÂTEAU DE BOTELAER, AT DEARNE, ANTWERP.

THE plants grown here are very varied, and most carefully tended. M. Florent Pauwels cultivates them for his own pleasure and that of his family only.

On February 22 I noticed in his Orchid-houses numerous fine *Cypripedium*, such as *Roebelini*, *Lathamianum* × (a remarkable variety), *Botelaerianum* ×, which I have already described in these columns, it having bloomed last September, and is now again bearing a fine flower; *selligerum* ×, *Chamberlainianum*, *Victoria Maria* of the *Chamberlainianum* class, especially as to form, the standard in colour a uniform pale olive-green, the petals very spiral, but not striped, the slipper salmon-red, but I think it inferior to *Chamberlainianum*; *C. melanophthalmum* × *hirsutissimum*, a very fine variety, with petals of unusual width and beautiful colouring, nicely spotted and with a blackish standard; *C. expansum*; *Lindleyanum*, with eight flowers, and which is rare; *albo-purpureum*, well coloured, and other varieties.

There were some fine specimens of *Vanda*, of *Cattleya Trianaei*, one of which had a very dark and bordered lip; *C. bogotensis*, nearly all white; *C. Schroderi delicatissima*; a well-flowered example of *Cologyne flaccida*; *Lelia asperbium*, rarely seen with us; two vigorous plants of *Phaius grandiflorus*, one with two, the other with three flower-stems, more than 3 feet long; *Auellia africana*, blooming freely; *Dendrobium aureum*, crassinode; and *Zygopetalum crinitum* in good variety.

Very admirable are the hundreds of blooms of *Odontoglossum Rosei majus*, which fill half a large house, and among which are some very pretty varieties; in the same house is a collection of *Lycaste Skinneri*, one plant of which is streaked with purple, and is flowering abundantly. *Chysis bractescens*, imported last year in January, is now flowering, and bears three good racemes of bloom.

M. Pauwels has, moreover, a most interesting collection of *Anthurium*, among those now in flower are *roseum superbum*, *Hooibrench*, M. Louis Fournier, M. F. Pauwels, and many good seedlings. He has also an increasing collection of *Crotone*, which are certainly not neglected in Belgium nowadays.

### HORTICULTURAL MEETING AT GHEENT.

At the meeting on March 1, some pretty Orchids were shown by M. Jules Ilye, including *Cypripedium Louis de Langhe*, a valuable acquisition; *Cymbidium Philbrickianum*; *Odontoglossum excelsum* var.

*Cavallinianum*, an admirable variety with a long raceme of splendid flowers, the sepals pale yellow, bordered with deep canary-yellow, and with two or three spots of carmine-red; petals white, broadly margined with yellow, and with four or five spots of crimson very conspicuous on the white ground, the lip beautiful and white; *Cypripedium Albertianum* var., which I think an excellent variety, and resembling *Spicerianum*—the standard is very broad, and together with the petals much spotted over the whole surface; *Cattleya Trianaei*, delicate in colouring; *Epidendrum Stamfordianum*, with eight pretty flowers of very pronounced colouring; *Odontoglossum Rokeri*, *Albertianum*, *roseum* and *Wilkeanum*.

M. H. Dallière staged *Cypripedium excelsum*, with a large flower with a beautiful standard.

In addition to the Orchids, the *Cyclamen persicum* *pavillo* from M. de Langhe *Vervaeae* may be mentioned as a feature of this meeting. The variety named Brussels Best won a Certificate of Merit *par acclamation* and *avec les félicitations* of the jury. These *Cyclamens* are a testimony to the skill and perseverance of the grower. At first sight the blooms suggest those of *Primula sinensis* in form; the petals are curling, spreading, and flat, thus much enlarging the flower. All the colours found in *Cyclamen* are here represented; in addition, some of these varieties have flowers bordered with yellow or white. This acquisition should lead to a new race of *Cyclamen* well adapted for bouquets.

M. de Smet Duvivier staged a collection of *Cyclamen persicum album giganteum*, well-grown plants, with large and numerous flowers with broad pure white petals, borne on very stout, straight peduncles.

The Société Horticole Gantoise showed two *Palme*, *Psychoraphis Augustae*, very graceful in foliage and bearing, resembling *Coccoloba Weddiana*, and *Bentleya nicobarica*, belonging to the group of *Palme* with large leaves, cut like those of a *Chamaedorea* the colouring tender green.

There were also shown two fine *Cliveiae* from M. Claeys and M. Gustave De Cock; a pretty *Caraguata cardinalis*, blooming well, sent by M. L. De Smet-Duvivier; and *Erica cucullata*, from M. G. De Saegher—these all obtained Certificates.

### SOCIÉTÉ ANONYME HORTICOLE LOUIS VAN HOUTTE PÉRE.

This firm is in the highly prosperous condition maintained by Belgian horticulture in general. Last year five new Palm-houses were built; this year fifteen others are in process of construction, and are also intended for *Palme*, *Dracænae*, and plants grown in a warm-temperate atmosphere.

### MEETING OF THE BRUSSELS ORCHIDÉENNE.

At the last meeting a natural hybrid attracted much attention—*Odontoglossum* × *rubiginosum*, apparently from *O. crispum* and *O. luteo-purpureum*. The ground-colour is greenish-yellow, much spotted with dark chocolate. This charming Orchid won a First-class Diploma of Honour *par acclamation*; it was shown by L'Horticulture Internationale (M. L. Linden). This exhibitor was also successful with *Odontoglossum Wilkeanum* var. *olivaria* a very large star-like flower, in colour dull olive-green; *O. W.* var. *elongatum*, with a larger and more brightly-coloured flower than the preceding variety; *O. W.* var. *fuscum*, pale sulphur-yellow; *Trichopilia suave*, blooming well; *Dendrobium Wardianum superbum*, a fine variety with a very large well-coloured flower; *Cologyne cristata alba*; *Cattleya Trianaei* var. *atrata*, with exceedingly delicate flowers, the petals a fine width, and the lip a good colour; *Burlingtonia Lindeni*, a basket bearing an abundance of trusses of small pretty white flowers; *Cypripedium Fascinator*, and other Orchids.

M. Ch. Van Wembeke staged a fine *Cypripedium Calypso*, a well-blomed specimen of *Odontoglossum pulchellum*, and *Cattleya Trianaei*, with a very large flower of remarkable colouring. *Cattleya Trianaei alba*, from M. Madoux, was the purest white that I have seen; the same exhibitor's *C. Trianaei* is an

enormous specimen, well flowered, and belonging to a good variety.

From the Royal Gardens at Laeken (Director, Mr. H. Knight) came *Dendrobium formosum giganteum*, very beautiful; *Odontoglossum crispum superbum*, flower nice and full, large, pure white, the sepals and lip well spotted. M. Van Cauwelaert sent a fine *Cypripedium Lathamianum inversum*, dark in colouring, and distinctive in form; and *Odontoglossum Rackeri*, a pretty shade of dull claret colour. *Cypripedium Lindleyanum*, from M. Florent Pauwels, was also much admired.

Two houses at l'Horticulture Internationale are stocked now with various species of *Odontoglossum* in full bloom, among them M. Linden has arranged some fine varieties of red-veined *Anthuriums*, and the effect is gorgeous. *Ch. de Bosechère*.

VITICULTURE IN NEW ZEALAND.

EARLY in the "sixties" Cape wines were very much pressed on the attention of the British public, but as the taste of the public had not been "educated" sufficiently, Glenlivet, Kinahan, and Allsop, continued, and continue, to hold their ground. Australia next went to work in the viticulture direction, and wine from that Continent is well known at home, though not, possibly, as Australian; and thus it is easy to understand how New Zealand has become anxious to be placed on the list of wine-producing countries—if it may not be able to send to market fresh fruits in competition with those from the Cape and elsewhere. In the "South Island" there would appear to be a very great field for the viticulturists, fine Grapes are produced, and fairly good wine made by growers for their own consumption. Most fruits of the temperate zone, and sundry subtropical products, luxuriate in company with the Grape-vine, and at last it was determined to invite Mr. Romeo Bragati, expert in viticulture to the Government of Victoria, to inquire into the whole subject and report. All of this he has done in an exhaustive manner, the only unsatisfactory part of his story being the record of phylloxera ravages in one district—some hundred Vines being affected in one vineyard.

Mr. Bragati writes:—"We journeyed to Auckland, and ascertained whether any of the Vines were stricken with phylloxera. On the Mount Eden Road, I regret to say, I found two vineries infected by this terrible pest. In both places I found 101 Vines affected. I at once communicated that fact to the Department of Agriculture of New Zealand, and I understand the necessary measures to eradicate have been taken."

In the course of many days' journeyings by rail and road, Mr. Bragati examined orchards and small vineyards, and was deeply impressed with the prospects of success, which he thinks could not fail to be attained by the proper outlay of capital in localities not too far removed from railways or other means of transport. Some folk have taken to growing the Vine under glass—a protection Mr. Bragati considers quite useless in such a country. He is of opinion that capital, co-operation, combined with intelligent methods of cultivation and treatment of the finished products, would certainly lead to a great measure of success; also that fruit-canning might be carried out as a very profitable enterprise. It is said to think how large a quantity of excellent fruit, as Apricots, Plums, Apples, Walnuts is thrown to the pigs after the quantity of each required for home consumption has been secured and preserved or otherwise treated. So down the far spreading and broadening valleys, dominated by mountain ranges, Mr. Bragati took his way, sorrowing at inevitable waste on farm after farm, but thinking of the prize yet to be won in the fields to which we have sent so many husbandmen. Horticulture - viticulture is handmaid to all the virtues, and in this pursuit the demon of strong drink is cast forth, and thrift, sobriety, and happiness helped to the front. And to all this may be added

a far-widening field for the gardener of every degree—for the members of many another trade, and all of our own English-speaking race. Such reports as that above alluded to are of great value to colonies struggling into competition with old-world countries, such as Spain, France, Italy, Germany; with such help, with scientific handling of all subjects engaged in, with energy and perseverance there can be but one result—success. E. C.

THE CARNATION AND ITS CULTURE.

(Concluded from p. 135.)

HEALTH and vigour of the Carnation, as of other horticultural plants, may be to some extent inborn qualities, yet their continuation it will generally be acknowledged depends, in a controlling degree, on favourable and congenial surroundings. It becomes obvious, therefore, that the prospect of success in Carnation culture, will stand in direct relation to our knowledge of what constitutes congenial circumstances in the case of these plants. The tendency towards degeneration in the Carnation is probably a deep-seated one, and is most likely due to slowly acting adverse circumstances of various kinds. In some instances it may be the result of an uncongenial climate, in others of an unsuitable soil, in others the lack of a proper supply of desirable plant-food; in others, again, to several of these adverse circumstances combined; and may be in all of them, to some extent at least, as stated by Dr. C. A. Goessmann, and suggested by Mr. Martin R. Smith, attributable to the weakening influence of our artificial system of selection and propagation. A system of manuring, whether for the Carnation or for any other plant, may be called well-devised or rational when it is based upon the results of a careful examination into the chemical composition of the plant under cultivation, and of a due consideration of its natural qualifications for availing itself of the needed plant-food, both from the atmosphere and from the soil. The relations of the various mineral constituents of the plant to its successful development must, also, be fairly understood in order to know what elements of plant-food ought to be present in the soil in an available form to render success possible.

For the purpose of answering some of these problems, and to determine if possible the cause of failure in Carnation culture after the first year's growth, Mr. Martin R. Smith submitted to chemical analyses some Carnation plants of one-year old growth in the season of 1894. Five plants were selected for examination, these being of a sturdy habit of growth, with stout robust stems and broad healthy foliage. The blooms had been removed. The average weight of each plant, including roots washed free from soil, was 13 oz.; the five plants, therefore, weighed just over 4 lb. The chemical composition of these plants in their fresh state was as follows: they contained 73.4 per cent. of water, and 26.6 per cent. of dry substance. When this dry substance was burnt to ash it yielded 3.08 per cent. of mineral matter. The fresh whole plants gave 0.474 per cent. of nitrogen.

On submitting the ashes of the whole plants—stems, leaves, and roots—to analysis, the following percentage results were obtained:—

Composition of the Carnation (whole plant).

	Per cent.
Silica ... ..	4.63
Iron and alumina ... ..	21.33
Carbonate of lime ... ..	22.41
Magnesia ... ..	2.18
Potash ... ..	29.16
Soda ... ..	2.88
Sulphuric acid ... ..	3.16
Phosphoric acid ... ..	12.56
Carbonic acid, chlorine, &c. ... ..	1.49
	100.00

So far as we are aware, this is the first chemical analysis of the Carnation that has ever been published. Let us see what it teaches.

In the first place, it may be remarked that the

amount of nitrogen (0.474 per cent.) is very high, and points to the fact that when the Carnation plant is subjected to a continual and heavy cutting, whether for blooms or for propagation purposes, the strain upon the constitution of the plant, and the draft upon the soil for nitrogenous plant-food, must be very great indeed, and shows the necessity of a constant and available supply of nitrogen by manure. In the second place the percentage amount of ash or mineral matter in the Carnation plant is high also, pointing to the fact that a full and available supply of mineral ingredients must be present in the soil to prevent plant exhaustion.

The composition of the ashes of the Carnation is remarkably significant, showing an enormous proportion of potash and of phosphoric acid. It is evident, therefore, that these two mineral constituents—potash and phosphoric acid—are in great demand by the Carnation plant for building up its fabric, and for maintaining health and vigour; but without a corresponding amount of nitrogen these mineral substances would prove comparatively useless. At the Massachusetts Experimental Station in the Horticultural Department, it was found when experimenting with Carnations cultivated under glass that out of thirteen different combinations of fertilisers, sulphate of potash with sulphate of ammonia gave the best results. In a second test of six single fertilisers, nitrate of potash gave the best results as to vigour of plant and production of blooms; sulphate of potash gave the next best results; while dissolved bone-black realised the poorest results, showing that phosphoric acid alone, that is without a combination of either potash or of nitrogen, is of little avail for Carnation.

Turning again to Mr. Martin Smith's analysis of the Carnation, we find that the actual amount of mineral ingredients in one plant of the average weight of 13 oz may be apportioned as follows:—

	oz.
Silica ... ..	0.019
Iron and alumina ... ..	0.088
Carbonate of lime ... ..	0.092
Magnesia ... ..	0.008
Potash ... ..	0.117
Soda ... ..	0.011
Sulphuric acid ... ..	0.013
Phosphoric acid ... ..	0.053
Total ... ..	0.400

The Carnation evidently requires a staying manure, that is one which becomes available slowly but regularly. Amateur gardeners frequently make a great mistake by adding an excess of manures at one time to their plants, and thereby condemn the manures if any damage is done. Many plants are doubtless spoiled by over-manuring, yet at the same time a deficiency of the necessary plant-foods is also detrimental to the proper growth of plants. Dr. A. B. Griffiths says, "There is nothing like a happy medium in manuring, as in other matters—excesses and deficiencies are alike injurious."

In order to determine the question of the amount of plant-food appropriated by the Carnation in its roots and in its above-ground growth—stems and leaves—analyses of these parts of the Carnation plant were made. The selected constituents are given below:—

Percentage Constituents in different Parts of the Carnation Plant.

Constituents.	In the Roots alone.	In the Stems and Leaves.
	Per cent.	Per cent.
Carbonate of lime ... ..	25.89	19.46
Magnesia ... ..	2.28	2.11
Potash ... ..	21.50	33.6
Phosphoric acid ... ..	8.94	14.01

We see from these results that the roots of the Carnation contain nearly 6½ per cent. more lime than do the stems and leaves. The magnesia varies but little in the different parts of the plant. The potash accumulates to the extent of over 12 per cent. more in the stems and leaves than in the roots and the phosphoric acid of the stems and leaves in

5 per cent. in excess of that in the roots. These facts show most conclusively that it is the above-ground portion of the Carnation plant that is the most likely to suffer, and to show exhaustion from a too severe process of cutting. *J. J. Willis, Harpenden.*

NURSERY NOTES.

ORCHIDS AT McARTHUR'S NURSERY, MAIDA VALE.

A very fine show of Orchids, and especially of the remarkably good, distinct, and well-bloomed varieties of *Dendrobium* noble, now beautify the largest Orchard-house in McArthur's nursery, Maida Vale. One group of them in which the true *D. n. nobilium* and three others, which are almost as good, were observed as effectively arranged with plants of *Cælogyne cristata* alba, *C. c. Lemoniana*, *Dendrobium Findlayianum*, *D. splendidissimum grandiflorum*, and other *Dendrobiums*, &c. On each side of the house are placed fine forms of *Cattleya Trianaei*, *Cypripedium* × *Lathamianum*, *C. × Swinburnei*, and other *Cypripediums*; *Ada aurantiaca*, *Saccolabium bellium*, *Cymbidium devonianum*, *Odontoglossum Rossi majus*, *Lycaste Skinneri*, and *Chysis bracteata*, which here thrives remarkably well, and even small plants are sending out good spikes of large wax-like white and yellow flowers. Among the importations sent home by the collector of the firm from Venezuela, are some good specimens of the curious *Mormodes baccinaria*; and quite lately received are a number of fine *Anguloa Ruckeri superba*, and a reputed new *Cattleya*, which if it answers the description given by the collector, should be a remarkable novelty. A new *Lælia* with very singular looking short, stout pseudo-bulbs, is among the new-comers.

J. VEITCH AND SONS.

One of the particular objects of interest at this nursery at the present time is the collection of *Hippeastrums*. Very many of our readers have doubtless an idea of the collection, and of the thorough treatment it receives, both of actual observation. For the benefit of others, it may be stated that the plants are housed in an excellent sun-roofed structure of considerable dimensions, with side-beds containing the later and smaller bulbs, and a higher middle-bed where the chief display is seen. All the pots are plunged out of sight, being neatly covered with tan, and in this manner a pleasing effect is secured. This season the plants have done remarkably well, and developed more foliage than is usual in the case of the earlier-flowering bulbs. The fine healthy foliage is also the most pleasing relief that could be afforded the showy flowers. Though we should be slow to limit the possibilities of any plant for further improvement, it has been evident for several years past that the old *Amaryllis* has undergone such transformations in regard to the form and size of the flowers that little else could be hoped for in the same direction. From the number of seedlings we saw at Chelsea, it was apparent that efforts are now directed towards obtaining greater variety in colour, and especially in the direction of albino or lighter-coloured varieties, such as the seedlings *Eros* and *Fedora*. The first-named is nearly perfect in form, and white over the greater portion, but there is veining, and partial irregular lines of bright red. The upper segments in this flower and others, is less white than the lower ones. *Eros* is very similar to the one just described, but the veining is more persistent. The variety looked a good one, it may be added, and it carried four excellent flowers. *Clonia* may be mentioned as another instance of the same kind of bloom, the greater part white, and what little colour there is present, being of a bright tint. But there is another direction where perfection is striven after, viz., a bright-coloured flower (as distinguished from the old peculiar red), marked with a clear white star. Such are *Emin* and *Maida*, and probably there are others. It is a type which many will regard with

favour. Of course, the selfs are not neglected, and among the latest seedlings are some splendid varieties, with flowers of various degrees in depth of colour, and all of great substance of petal. *Ovis* is an instance; and in this and some other cases the green or white base is entirely obliterated. *Marcus* is another superb flower, of similar characteristics; and *Rugia*, a specially bright rosy-crimson, very rich, and satisfactory in form. Then there are self-coloured ones, possessing a prominent green star, as *Owick*, a bright rosy-crimson flower, and others. A seedling named *Geta*, and a few like it, exhibit a new shade of purple over the flowers.

The last we can now mention is *Idalus*, but it is not the least in regard to size. The orange-red flowers of this variety are uncommonly large, but they do not possess the finer qualities in those others we have selected for notice. The collection will be more fully in bloom a week hence, and we think few who are near the place will think the plants unworthy of an inspection. The variation in the seedlings will be found to be on the lines indicated in this brief notice.

FLORISTS' FLOWERS.

THE AURICULA.

SINCE the remarks made on p. 84 were written the weather has been most favourable to all the sections of the Auricula. The cultivator, however, should carefully note any changes that may take place in the weather. If an east wind occur, double the number of mats will be necessary for the frames, and if the plants are in the house, sufficient heat must be maintained to keep the temperature above the freezing point. Auriculas cannot be forced by artificial heat with any degree of success. One-half of my collection was in frames, and the other half in a heated house, when the sharp frosts on three successive nights occurred a few weeks ago; the thermometer registered 12°, 15°, and 15° of frost respectively, but with double mats over the glass-light, the plants have not received the least injury. Care is now necessary in the supply of water to the roots. It is very injurious to the plants if allowed to become over-dry at the roots. Admit air as freely as possible during fine, warm weather, and avoid draughts in the event of cold winds.

THE PINK.

The garden Pinks, though easily grown, and hardy enough to thrive in any garden, are yet well worth some extra care and attention. The plants in beds and the open border have required making firm in the ground after the recent frost, and the addition of some rich compost around the roots is very helpful to them. A hardy plant like the Pink, which loves the free, open moorland, does not succeed in a close, stifling atmosphere. Forcing must be so managed that the plant does not feel the process. The plants are a long time before flowering, and it is best to start them in a temperature just a little above that of the greenhouse, increasing it slowly to 45° or 50° at night. The plants should be kept as near the glass as possible, and in such a position that the air will blow amongst the plants. Never must the night temperature exceed 55° to 60°. Cuttings or slips may now be put in, to obtain strong plants for forcing next season; the slips root even more freely than those of the Tree-Carnation, and their treatment is much the same in every way, except that the young Pink plants, as soon as they are strong enough, should be planted out in the open border, to be lifted and potted up in the month of September, so that the plants may be well established before they are taken to be forced.

THE PANSY.

The Pansy is even more difficult to force than the Pink, yet it is surprising what beautiful flowers are shown in April at the spring exhibition held at Newcastle-upon-Tyne, and to obtain flowers at that time in the North, some forcing is necessary.

The plants should be potted into their flowering-pots in February or early in March, in an open sandy compost containing good yellow loam, a fair proportion of leaf-mould, well-enriched with decayed cow-manure, and with plenty of sand added. The pots should be from 6 to 8 inches in diameter. The plants should be relieved of all flowers and flower-buds at the time of potting, and the growths may be pegged down over the surface of the soil. The plants must not have more than a greenhouse temperature, and they do best in a low pit where the lights may be removed whenever the weather is fine. Very beautiful blooms, however, may be obtained in March and April from ordinary garden frames. For very early blooming the plants should be put into their flowering-pots in September of the previous year, and some care is necessary in watering them during the winter months. *J. Douglas.*

SOCIETIES.

MANCHESTER ROYAL BOTANIC.

MARCH 13, 14.—The first show of the season, under the auspices of the Manchester Royal Botanic Society, was held in the Town Hall on the above dates. Orchids formed the chief feature, these plants covering two-thirds of the table space round the walls and centre of the magnificent hall, quite eclipsing the more modest beauties of the spring bulbs, &c. *Dendrobiums* were numerous, and seemed to command the most attention from connoisseurs—indeed, this genus formed a large moiety of the exhibition.

Among the chief amateur exhibitors were E. ASHWORTH, Esq., Harefield Hall; THOMAS STATIER, Esq., Stand Hall; W. THOMPSON, Esq., Waltho Grange, Stone; H. WEETMAN, Esq., Little Haywood, Stafford; and SAM HINCHLIFFE, Esq., Hale, Altrincham. In Mr. ASHWORTH'S collection were some choice *Dendrobiums*, including *D. splendidissimum grandiflorum*, with thirty six flowers on one pseudo-bulb, the blooms of surpassing brilliancy, which received a Floral Commendation; *D. Schneiderianum*, with immense flowers—this is one of the most striking crosses. We also note *D. nobile Sandersi*, a chaste flower of moderate size, with fine soft tints—after the way of *D. × Rolfei*, but in no way its equal. *D. nobile Hardyana* was also good. In this collection were some *Cattleya Trianaei*, pretty *Odontoglossums* of various species, good-flowered *Lycaste Skinneri*, and many other Orchids well shown by Mr. HOLBROOK.

Mr. STATIER'S collection (gardener, Mr. Johnson), was, as usual, well to the front. Nothing could be finer than the pure white *Dendrobium nobile Amesiae*, *D. n. Schroeterianum*, &c.—or by whatever name it is called, it is a flower of great beauty, that well merited the First-class Certificate awarded to it. The cultivation of the Stand Hall *Dendrobies* stood out prominently, but we have seen the flowers of both *D. nobile nobilium* and *D. splendidissimum grandiflorum* much finer than on this occasion. The *Cypripedium hirsutissimum* called the Stand Hall variety is a dark-coloured gem, the varnished flowers very striking, and the dorsal sepal, which is rather small, has a striking appearance from the blackish-purple flushing, surrounded with a broad greenish-yellow margin. The two plants of *Cælogyne cristata*, with quantities of racemes, showed good culture; and the piece of *Cypripedium Southgateense auratum* was by far the choicest and most beautifully spotted exhibited.

Mr. MUNSON (gr., Mr. Stevens) maintained a 1st place with *Odontoglossums*, and although it is not the season to see *O. crispum* at its best, there were several very good ones, some with racemes bearing about twenty flowers of good size and form. Among the varieties were *O. elegans*, with a fine arching raceme, bearing flowers resembling *O. Andersonianum*, but more elongated in the segments, and arching in outline. The ground-colour is white, and the spotting a rather pronounced Indian-red. The panfuls of *O. Rossi* in its largest forms were good; the fragrant *Dendrochilum glumaceum*, a lovely Orchid; and the bright colour of *Mesospidium vulcanicum*, told well in the group.

Mr. WEETMAN'S plants were under the charge of Mr. Keeling, Bradford, and a very good lot they were. The best *Deadrobie* here was *D. nobile elegans*, a grand form, having both size and substance in the flowers; and one called *D. n. Weetmani* is after the style of *D. nobile var. Sandersi*. *D. × Dominianum* is still holding its own among novelties, and as a specimen plant it is very telling. The specimen of an *Odontoglossum triumphans* had fine flower-spikes; as also did *O. luteo-purpureum*, which is what we once grew as *O. radiatum*, was excellently flowered. One of the best examples of *Oncidium speciosum* we have seen was in the exhibit, the rich, brindled segments contrasting well with a thick lemon-coloured, roundly-ovate labellum.

Mr. HINCHLIFFE made a very creditable first appearance at showing, his collection filling one of the corners of the hall. The *Oncidium scrodes* in several plants were finely grown, and the large panicles of brown and yellow flowers went well with those of *Cymbidium Lowianum* and confronted with *Deadrobiums*, among which was a well-flowered *D. Cooksoni*. Some *Odontoglossums* were notable, particularly a pink-flushed and blotched *crispum*, some *O. Harryanum*,

several *Cypripediums*, the whole enlivened with bright-leaved *Codiaeums*, and set amongst *Palms* and *Adiantums*.

The trade collections were represented by Mr. J. CYPHER, Cheltenham; Mr. J. ROBSON, Bowdon; Messrs. HEATH & SON, Cheltenham; B. S. WILLIAMS & SON, Holloway, London.

Mr. CYPHER put up a grand collection, particularly of *Dendrobiums*, and received the only Gold Medal awarded at the show. Chief among his *Dendrobies* were *×Ainsworthii* Cypheri. This is the finest flowering and richest coloured of all the *Ainsworth* section. The plant had about 200 flowers on it. There were several types of *D. nobile*, but good plants from Mr. STATTER, and good flowers of *D. nobile nobilium*, were conspicuous by their absence. *D. nobile pulcherrimum* is an exceedingly dark flower, but wanting in good form. There appear to be several varieties of the pale *D. ×Cypheri*; one plant here was full of good flowers, showing albeit what cultivation can do. The whole of a large number of seedling *Dendrobies*, and selected imported plants, were clean and well grown. A very good form of the shy-flowering *Cattleya speciosissima* was noted, and many forms of the enduring *C. Trianaei*, along with the brilliant reddish-flowered *C. Lawrenceana*, *Cypripedium villosum*, and a seedling *×Druryi* were conspicuous for good quality. This form is strong in the umbellate *Epidendrum*, of whose *O'Brienianum* and *xanthinum* were exceptionally good, and do not become lanky like the old but beautiful *E. rhizophorum*.

Mr. JOHN ROBSON had a rich display, and his *Dendrobiums* were varied and good, *D. Wardianum* being very notable; and *D. Cooksoni* was a fine specimen covered with flowers. Some of the dark *D. nobile* type were very striking, and a light one of the albiflorum type received a First-class Certificate. We noted also some good *D. crassinode*, the beautiful *Cymbidium eburneum*, some good *Phalenopsis*, including the prettily-spotted *Stuartiana*, and a miscellaneous lot of altogether a hundred plants effectively arranged.

Messrs. HEATH & SON had *Dendrobium nobile giganteum*, a magnificent variety, far eclipsing *D. n. nobilium* for form, although not quite so rich in colour. It is not unlike a good *Phalenopsis Aphrodite* in form and closeness of segments, and altogether was one of the most captivating plants in the show. Along with this were *Cymbidium Lowie-eburneum*, a beautiful piece, with fifteen flowers; some good *Cattleya Trianaei*, the unique *Cypripedium Rothschildianum*, a good *C. Argus Moensii*, and the larger form of *C. Swioburnei*.

#### MISCELLANEOUS.

B. S. WILLIAMS & SON staged chiefly a good lot of *Cyclamens* and *Heaths*, with a sprinkling of *Oreohids*, among which the hybrid *Calanthes* were telling. Among other exhibitors, DICKSONS, Chester, had a grand display of *Daffodils* arranged in an effective manner, confronted with the pretty purple *Iris reticulata*, and the effective *I. stylosa × Blacina*, and several bits of *Primula denticulata* in white and other colours.

Mr. B. FINDLAY sent from the Royal Botanic Gardens a fine lot of *Hyacinths*, *Narcissus*, and other bulbs, nesting amongst *Palms*, &c., along with some miscellaneous *New Holland* plants. *Boronia megastigma* is always welcome. The two specimens of the Old Man Cactus (*Pilococcus senilis*) commanded attention, and there were several good *Lycastes* and *Dendrobium Wardianum*.

DICKSON, BROWN & TAIT had a considerable assortment of well-grown and well-flowered *Hyacinths* and other bulbs.

JOSEPH BROOME, Esq., Sunay Hill, Llandudno, sent admirable bunches of cut flowers from hardy plants, which diffused fragrance all around, consisting of *Wallflowers*, *Stocks*, *Primroses*, *Polyanthus*, &c.

Messrs. JAMES & SONS, Farnham Royal, sent a group of flowers of *Cinerarias* of remarkable size, form and substance, some of the flowers measuring 3 inches across.

Messrs. EDWARDS & SON, floral decorators, had lots of designs in wirework filled in with *Ferns*, *Asparagus plumosus*, *Smilax*, &c., making an effective group.

The MOSS FARM Co., Chorlton-cum-Hardy, exhibited a very excellent sample in three different lots of *Mushrooms* grown in the open air on one of the reclaimed farms of the *Widlington Local Board*.

The opening day was wretched, and the attendance correspondingly so.

### CRYSTAL PALACE.

MARCH 14.—The exhibition of bulbous and other spring-flowering plants at the Crystal Palace on Saturday last, was not quite equal to our expectations. Last season, under quite opposite climatic conditions, the *Hyacinths* and other bulbs then staged had necessarily been subjected to considerable forcing in order to hurry them for the show. Under these circumstances, it would be no wonder had they been of indifferent quality. *Hyacinths* at any rate, however, were not so good on Saturday as shown last year, and the show of most subjects was not by any means large. A few of the exhibits were nevertheless very noteworthy, and in this respect may specially be mentioned the collections of *Cyclamens*.

The best collection of *Hyacinths* as usual was from Mr. JAS. DOUGLAS, Great Gearies Gardens, Ilford, who had 1st prize for thirty-six plants. It may be useful to append the names of the best varieties shown. They were *Levathan*, *Mont Blacc*, *Snowball*, *La Grandesse*, white; *Amelia*, and *Lady Clinton*, blush. The last-named is a very fine new single-flowering blush variety, produces a good strong spike of large flowers; *Souvenir de J. H. Veen*, *Captain Boyton*, *Sir H. Berkeley*, and *Kiog of the Blacks*, dark blue

or purple; *Lord Derby* and *Czar Peter*, very pale blue; *Roi des Helges* and *Vurbaak*, red; *Chas. Dickens* and *Rosea maxima*, rose; and *King of the Yellows*. The 2nd place was taken by Mr. JAS. GIBSON, gr. to E. H. WATTS, Esq., Devonhurst, Chiswick; and Messrs. J. WINTER & Co., Bon Marché Nursery, Gipsy Road, West Norwood, were 3rd.

Mr. DOUGLAS won 1st honours for *Tulips* also, with thirty-six plants in very fine flower, and exhibited with fresh well-coloured flowers; Mr. W. Howe, gr. to H. TATE, Esq., Park Hill, Streatham Common, was 2nd; and Mr. J. GIBSON 3rd.

*Narcissus* of the *Daffodil* section were well shown by Mr. WM. HOWE, who gained 1st prize with twenty-four plants, none of the varieties being exceptional ones; Mr. JAS. GIBSON was 2nd. In the similar class for varieties of the *Polyanthus*-flowered section, Mr. DOUGLAS again was 1st, being followed by Mr. HOWE and Mr. GIBSON.

In the class for thirty-six plants of *Cyclamens*, the ST. GEORGE'S NURSERY Co., Hanwell, made a most meritorious exhibit. The plants were pictures of a good habit and well-flowered strain, and all the flowers of clear colours or pure white. Mr. J. G. Mowbray, gr. to Meior Ho. H. C. LEGGE, Fulmer Gardens, Slough, was 2nd, whilst equal 3rds were awarded to Mr. THOS. WALKER, Gordon Nursery, Staines Road, Hounslow, and Mr. THOS. PESTRIDGE, Boston Park Road Nursery, Brentford.

Mr. DOUGLAS, with a nice collection of seedling varieties, was 1st for twelve plants of *Amaryllis* in flower, and Mr. WM. HOWE followed. Mr. JNO. R. BOX, Croydon, was the only exhibitor of *Cinerarias* in the larger class.

Twenty-four Chinese *Primulas* were shown best by Mr. JAS. BATEMAN, gr. to Mrs. KING, Southwood, Sydenham Hill, but sufficient coloured varieties were not included; Mr. J. G. Mowbray was 2nd.

In the larger class for *Lilias* of the Valley in 8-inch pots, Mr. THEODORE JANNOCH, Dersingham, won with nice plants in 8-inch pots. *Mignonette* was not shown in a manner needing remark. There was only one collection of greenhouse *Azaleas* exhibited, and Mr. ROBT. WELLS, Longton Nursery, Sydenham, was awarded a 1st prize. The plants were well-flowered, and were nice and fresh-looking. Many classes in the schedule were without entries, and the remaining ones are for a smaller number of plants than those already noticed, and from which the previous exhibitors were debarred.

Thus, Mr. JAO. SCHUMACHER, gr. to M. JACOB, Esq., Lywood, Gipsy Hill, took a 1st prize for twelve *Hyacinths* in pots; Messrs. JAS. WINTER & SON for twelve *Tulips* and for twelve *Narcissus* (*Daffodil* section); Mr. THOS. CROSSLAND, gr. to W. M. BULLIVANT, Esq., Homewood, Beckenham, had 1st for twelve *Cyclamens*—in this case the flower-stems were unsatisfactorily slender, and each supported by a neat stake. Mr. C. Lane, gr. to E. H. COLES, Esq., Burntwood, Upper Caterham, won for twelve *Cinerarias*; and Mr. M. Webster, gr. to E. J. PRESTON, Esq., Keley Park, Beckenham, had the best twelve *Primulas*. There were four prizes awarded in this class, including two equal 3rds.

Mr. JAS. GIBSON secured a 1st prize for pots of *Lilies* of the Valley, but most of the exhibits in this class had apparently been recently potted up, and the flowers flagged a little.

There were several exhibits of a table of *Cyclamens* arranged with a few *Palms* and *Ferns* on a space of 60 square feet, but again the ST. GEORGE'S NURSERY Co. took the leading position; Mr. THOS. PESTRIDGE was a good 2nd.

For a miscellaneous group of decorative plants, only one exhibit was staged, and this was from Messrs. J. LAING & SONS, Forest Hill, London, S.E., a firm who is particularly happy in such work. The group in this instance was an interesting and beautiful one, and was composed of a choice lot of foliage plants in superb condition. A few *Orchids*, *Begonias* (winter-flowering), *Cleiveas*, &c., were judiciously used to brighten the exhibit.

*Honorary Exhibits*.—The most extensive of these was from Messrs. W. CUTBUSH & SONS, Highgate Nurseries, London, N., who staged about 100 *Hyacinths* in pots, half as many *Tulips*, and a table well filled with forced spring-flowering plants and other species.

Messrs. J. JAMES & SON, Woodside, Farnham Royal, exhibited a small group of their famous *Cinerarias*; and *Cinerarias* were also shown by Mr. JNO. R. BOX, The Nurseries, Croydon.

Mr. THEODORE JANNOCH made an exhibit of *Lilies* of the Valley in his usual tasteful manner; and Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, N., had a collection of *Hyacinths*, &c., in pots.

A magnificent group of *Camellias* in pots, and a collection of bloom; also, was shown by Messrs. WM. PAUL & SON, Waltham Cross, Herts.

### ROYAL BOTANIC.

MARCH 18.—The first show of the year by the Royal Botanic Society was held in Regent's Park on Wednesday last, under the worst possible conditions of weather. The long corridor, in which the spring shows are usually held, was quite filled with exhibits, and there were more in the large conservatory. The display was consequently a good one, and the exhibits bright and of interest, but thanks for this were due to members of the trade, who contributed very largely. On the other hand, the few Scheduled classes were the subjects of but little competition, and in a measure, therefore, they were dull.

In the competitive classes, 1st prizes were taken by Mr. JAS. DOUGLAS, gr. to Mrs. WHITTOURNE, Great Gearies, Ilford, for twelve pots of *Crocuses*, twelve pots of *Tulips*, twelve pots of *Narcissus* (*polyanthus*), twelve *Hyacinths*, six *Danxia gracilis* in flower, and also shared an equal 1st prize with Mr. Hy. Perkins, gr. to the Hon. W. F. SMYTH, M.P., Greenlands,

Henley-on-Thames, for twelve plants of *Hippeastrum* in flower. Mr. R. Scott, gr. to Miss FOSTER, The Holmes, Regent's Park, was 2nd in all of these, omitting the *Deutzias* and *Hippeastrums*.

Mr. SCOTT had also a 1st prize for six greenhouse *Azaleas* in flower, showing nice well-flowered plants. Although there was but little competition in the above classes, the quality of the subjects staged was very worthy of commendation.

Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham, received 1st prize for a small group of hardy herbaceous plants; and Mr. M. Webster, gr. to G. J. PRESTON, Esq., Keley Park, Beckenham, was 1st for six Chinese *Primulas*, being followed by Mr. ODELL, Violet Farm, Hillingdon. The quality of the plants in this class was average.

In the *Cyclamen* competition matters were not so tame. The 1st prize was well won by the ST. GEORGE'S NURSERY Co., Hanwell, who exhibited in their customary admirable manner; the 2nd prize was awarded to Mr. PESTRIDGE, Boston Park Road Nursery, Brentford; and an extra prize was taken by Mr. A. G. BOWLES, Church Road Nursery, Hanwell.

#### HONORARY EXHIBITS.

A display of *Hyacinths* in pots in considerable variety, also *Tulips* in pots, was made by Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, N. Messrs. WILLIAMS likewise exhibited a group of *Azalea mollis*, a collection of their excellent *Cleiveas* in flower, and a bright seedling *Hippeastrum* named A. J. Balfour.

Messrs. WM. CUTBUSH & SON, Highgate, London, and Barnet, Herts, exhibited an extensive collection of plants, which occupied quite half of one side of the corridor. This was made up of a large number of well-grown *Hyacinths* in pots; an almost equally numerous collection of *Tulips*, a very pretty group of hardy plants, some varieties of *Souvenir de la Malmaison* *Carnations* in pots, and a group of plants in general use for spring forcing purposes; also a few excellently-grown *Boronia*s and other hard-wooded species.

A very pretty group of miscellaneous plants was made by Messrs. J. FEED & SONS, West Norwood, in which they included some pretty decorative foliage plants, and in addition a few well-flowered *Heaths* and *Azaleas*, *Boronia*s, *Lilacs*, *Cleiveas*, and *Orchids*.

The best lot of *Cyclamens* among the honorary exhibits was a collection from the ST. GEORGE'S NURSERY Co., Hanwell, in which the coloured and white flowering varieties were alike commendable. Another collection was shown by the CHURCH ROAD NURSERY Co., Hanwell, and a third from Mr. THOS. PESTRIDGE, Boston Park Road Nursery, Brentford, and a fourth from Mr. ODELL.

Messrs. S. CARTER & Co., High Holborn, made a considerable exhibit of *Cinerarias*, of a good strain, and Messrs. J. JAMES & SON, Woodside, Farnham Royal, had also a group of first-class *Cinerarias*. Messrs. CARTER in addition showed a few plants of the *Primula* *Boquet*, in which the enlargement of the calyx before noticed has been fixed.

*Daffodil* blooms and many hardy plants in flower were exhibited by Messrs. BARR & SON, King Street, Covent Garden.

T. H. BURDOUGH, Esq., showed a fine lot of flowers of varieties of *Anemone hortensis*; also blooms of *A. apennin* and *A. a. var. blanda*.

Messrs. WM. PAUL & SONS, Waltham Cross, Herts, again made a beautiful display of *Camellia* plants in flower, and exhibited a large number of cut blossoms of same; also a few pots of *Roses* in bloom.

Mr. GEO. MOUNT, Exotic and Rose Nurseries, Canterbury, staged a pretty collection of *Roses*, many of them show with long stems and healthy foliage.

From Mr. Wells, gr. to T. B. RICHARDS, Esq., Woodford, came a group of large *Gloxinia* plants in flower.

Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E., staged a group of miscellaneous plants, including *Azaleas*, *Caladiums*, *Cleiveas*, *Acacias*, *Orchids*, *Ficus Canooca*, *Pteris tremula elegans*, and other species. Messrs. LAING staged a collection of *Apples* also.

Mr. THOS. S. WARE, Hale Farm Nurseries, near Tottenham, made a very extensive display of *Daffodils* in pots, also cut flowers of same, and in addition a number of *Anemone* blooms, and various other hardy species.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, Chelsea, exhibited a small group wholly composed of new or interesting plants. This included a few seedling *Hippeastrums*, two greenhouse *Rhododendrons*, *Purity* (white), and *Yellow Perfection*, both handsome varieties; *Davallia tenuifolia* *Burkai* and *Polypodium Schneideri*, two graceful habited drooping *Ferns*, and a few new hybrid *Orchids*; also a nice plant in flower of *Dendrobium nobile nobilium*. Messrs. VEITCH contributed likewise a group of the blue-flowered *Primroses*.

Mr. C. Last, gr. to H. O. O'HAGAN, Esq., Riverholme, Hampton Court, showed a large plant of *Dracyna latifolia*, a plant with thick, fleshy-green leaves of considerable length.

## THE BULB GARDEN.

### THE LILIES OF THE EAST.

MR. J. G. BAKER, of the Royal Gardens, Kew, has written me as follows regarding the latest introduction of this special description:—"The only new Asiatic Lily recently introduced into cultivation is *Lilium Szchenseae*, a bright red large-flowered *Magdalen*, with narrow leaves, allied to *L. Maximowiczii*. There are about ten *Lilies* in China (species, I mean)

not yet introduced." I hope that the Lily to which Mr. Baker has referred may prove as attractive in aspect and as vigorous in character as its immediate Chinese predecessor, *Lilium Henryi*, at present coming up with great strength in my garden. It is one of those rare varieties of the Eastern Lily which seems to improve and grow stronger every year. There are not many that could be thus described; but among those which I can recommend by reason of their possession of this important qualification, are *L. speciosum* Kraetzner, *L. auratum* platyphyllum and *L. monadelphum* Szovitzianum. It would also be an unpardonable omission did I not mention *Lilium candidum*, which (it may not be generally known), received this name from the great Italian poet Virgil; while Propertius called it, with even greater poetic expressiveness, *Lilium argenteum*. I find it both enduring, and exceedingly prolific; it is also the most decorative Lily in my garden, each stately spike seldom generating less than seventeen spotless and highly-fragrant flowers. I think this noble Lily should be planted more extensively in aristocratic gardens—where, I greatly fear, it is seldom to be found. *Lilium longiflorum* in its various forms, of which the most interesting is *Takeima*, is even more productive than the *Madonna Lily*; but I do not find that it is equally vigorous; and it has an inevitable tendency to degenerate in size and vegetative capability, owing to the excessive multiplication of its bulbs. I, therefore, periodically reduce its numerous offspring, and give them a considerably wider circulation; when grown in the open air it proves much too attractive to swarms of noxious insects, which in a very short period undermine its beauty, by destroying its complexion. *David R. Williamson.*

THE WEATHER.

[The term "accumulated temperatura" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending March 14, is furnished from the Meteorological Office:—

"The weather during this period was very cloudy or dull in all but the most northern districts. Rain was of frequent occurrence, although the amounts were generally small,

Towards the end of the week, however, considerable falls of rain, sleet, or snow were experienced at some of our north-easterly stations.

"The temperature was subject to considerable changes, but except in 'Scotland, N. and E.,' was in excess of the mean. In 'England, S.W.,' and the 'Channel Islands,' the excess was as much as 6°, and in 'England, S.,' and 'Ireland, S.,' it was 5°. The highest of the maxima were recorded on the 8th or 9th, when they ranged from 61° in the 'Midland Counties,' and 60° in 'England, E. and S.,' to 53° in 'Scotland, N. The lowest of the minima were registered either on the 13th or 14th, when the thermometer fell to 20° in 'Scotland, E.,' and 22° in 'Scotland, N.,' and to between 26° and 32° in most other districts; in 'Ireland, S.,' however, the lowest reading was only 34°, and in the 'Channel Islands,' 44°.

"The rainfall did not differ very materially from the normal, but was somewhat in excess in most parts of England, and either equal to or a little less than the normal over Ireland and Scotland.

"The bright sunshine exceeded the mean in 'Scotland, N.,' but in all other places there was a deficiency, that in most districts being very decided."

OLD POTATOES.

Trade is still very dull, and the prospects for a had finish seem to become daily worse.

NEW POTATOES.

Arrivals are gradually increasing in quantities. Best samples are selling freely, at 18s. to 22s.; ordinary, from 12s. to 14s. Small parcels from Malts, 12s. to 18s.

Reports from Jersey (Outdoor Crop):— Mild weather is favouring rapid growth, and some of the earlier spots will be fit to earth-up this week." J. B. Thomas.

SEEDS.

LONDON: March 18.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that business in field seeds is still confined to narrow limits. Quotations generally are unchanged, and continue at a very low level. Meantime the supplies all round are this season very abundant, and of excellent quality. Spring and winter Tares realise former rates. For Bird-seeds the sale is slow. Blue Peas and Haricot Beans are neglected. Rape seed is firm. Mustard continues quiet.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending March 14, and for the corresponding period last year:— 1896: Wheat, 25s. 5d.; Barley, 21s. 3d.; Oats, 13s. 10d. 1895: Wheat 19s. 9d.; Barley, 21s. 7d.; Oats, 13s. 8d.

ADDRESS: Herr Gussma, Klagenfurt, Austria.— J. Burrows, Mr. W. Collins, 9, Martindale Road, Balham, London, S.W.

BAROMETRE READING IN NORTH OF SCOTLAND: W. B. The printed figures, 27.64, agree with those in our correspondent's MS.

BASKETS AND BOXES. If Mr. W. Davis will send his full address, we will place him in communication with a commission agent who will furnish him with manufacturers' names who supply baskets, chips, &c., for marketing Strawberries.

BULBS: T. W. The bulbs are swarming with mites and other insects.

CAMELIAS: J. S. The stalk of a Camellia is very small in proportion to the mass of petals it has to carry. In consequence, the juices from the stem are not conveyed in sufficient quantities, and the buds fall off. The indication is that there are too many flowers, and the tree is ridding itself of the superfluous buds.

CATLEYA ROOTS WITH SMALL YELLOW GRUBS IN THEM: Anxious. The appearances seem quite sufficient to confirm your suspicions. R. McL.

CULTIVATION OF FRUITS UNDER GLASS, TOMATOS, ROSES, &c.: R. J. G. Firstly, we cannot assume the responsibility of advising you to settle in any particular town in the North, although we may do so to the extent of choosing a town, the neighbourhood of which is not too smoky or otherwise insalubrious for carrying on gardening pursuits. You ought not to get amongst the congeries of big towns, of which Leeds and Bradford are the more populous, choosing rather the northern parts of the counties of Nottingham and Lincoln, and some part of those near a railway station, on, or in connection with the main line. Span-roofed houses having low side walls, and a width of 14 or 16 feet, are suitable for Vine-cane growing, and these should have brick-beds for holding tanner's bark on either hand, or for being otherwise heated. A larger house than this is perhaps cheaper, and if it were 18 or 20 feet wide, there would be space to have a 6 or 8-foot wide bed in the middle, as well as side-beds. Vine shoots could be obtained in January by advertising your requirements.

CYCLAMEN: S. F. & Co. A very good strain; flowers of large size, good substance, and bright colour, but the petals are hardly wide enough.

DENDROBIUMS GOING OFF: Vitis. Kindly send specimens of flower-spikes so lost, together with a pseudo-bulb or two.

DRAWING SERPENTINE LINES: Constant Reader. If you are unable to draw these by the aid of the compasses and rule, you can purchase a variety of curves in woden models at the dealers in drawing materials. They are thin pieces of wood, with a variety of curves on the outside as well as within.

ECHINIS: F. R. B. Yes, plenty.

FUNGUS ON TOMATO PLANTS: A. B. Too immature to bame.

GARDEN LABELS: R. A. No sort of writing-ink will remain legible for any length of time on parchment or linen labels used out-of-doors. We should advise you to use some kind of oil-paint of a bright colour instead.

GORSE AND BROOM SEED PER ACRE: A. Y. Z., Seven Sisters Road: 20 to 24 lb. per acre.

**IXORA ROOTS DISEASED:** *F. G. G.* The roots sent are infested with a minute worm, *Heterodera radicola*, belonging to the natural order of the Nematoids. A great many species of plants are affected by these worms, including *Coffea*, *Gardenia*, *Cucumis*, *Lactuca sativa*, &c. See an article in *Gardeners' Chronicle*, p. 488, April 9, 1887. There is no known cure for the evil, and you should clear out the plants and burn them, and char the soil.

**LASCH:** *A. L.* A bad case of Larch-bliester, which has occupied so much of our space of late years. The history and progress have been repeatedly commented on, but unfortunately no cure has been devised on the large scale.

**MARKET ACACIAS:** *G. B.* *Acacia dealbata*, *A. cyanophylla*, *A. Farnesiana*.

**MUSHROOM SPAWN:** *J. M.* Without testing the growing powers of the spawn, we are unable to state positively that it is either good or bad. You furnish no particulars as to its age, the degree of heat it has been exposed to, or whether the place in which it was kept was moist or dry.

**NAMES OF FRENCH JOURNALS IN WHICH A GARDENER MIGHT ADVERTISE:** *Le Jardin* and *Revue Horticole* in Paris, *Gazette* in Nice, *Le Courier* in Versailles.

**NAMES OF FRUIT:** *A. Parry.* Blenheim Orange Pippin.

**NAMES OF PLANTS:** *W. S.* *Cornus-mas*.—*W. B.* *Acacia*.—*Ochrid.* 1, *Phillyrea media*; 2, Evergreen Oak; 3, Falbalm Oak; 4, Evergreen Oak.—*G. M.* Such enquiries should be sent to the editor, not to the publisher. 1, *Cypripedium thycoides*, E. United States; 2, *Juniperus sinensis*; 3, *Polygala chamaëxylon*, Switzerland; 4, *Cornus-mas*, Cornelian Cherry, Central Europe. Thank you for sending good specimens, properly packed and labelled, a rare occurrence.—*J. C., Selkirk.* 1, is a very fine and distinctly spotted form of *Odontoglossum crispum*; and 2, one of the best *O. luteopurpureum* we have seen.—*T. F. Young* is simply *Coleogyne cristata*.—*J. R. Young* is but a good ordinary form of *Odontoglossum Roseii* majae.—*C. W. Plenrothallis longissima*.—*W. B.* *Acacia cyanophylla*.

**NOTICE TO LEAVE EMPLOYMENT:** *F. E. G.* It would be more consonant with gardening customs to accept and give a month's notice—everything, of course, being as it should be.

**ODONTOGLOSSUM CRISPUM:** *R. C. W.* Your flower is an exceptionally good one, and the variety is a valuable one.

**PEACH LEAVES:** *H. B. P.* The silver-leaf disease, due to the attack of a fungus.

**PHLEGNOPSIS SPOT:** Your *Phlegnopsis* are affected with what is known as "spot," and for which no remedy has as yet been discovered.

**ROSES IN A VINERY, &c.:** *Vitis.* In the earlier stages of both Rose and Vine the two will do very well together, but when the temperature of the vinery reaches 60° and higher by night, and the foliage begins to grow large, a vinery ceases to be a good place in which to keep Roses, and the plants ought to come into a cooler, lighter, airier house. Against thrips use Richard's XL-All Vaporiser.

**ROYAL GARDENERS' ORPHAN FUND**—The mother and nominators of the orphan, Seymour Small, desire to thank the subscribers, whose votes placed him on the fund at the recent election.

**"STONES" BROKEN UP FOR MANURE ON THE FIELDS:** *H. W., Marburg.* Coprolites (phosphate of lime) or chalk-Kreide may be meant by your informant. The former are usually treated with sulphuric acid before being used as manure, and the latter is merely exposed to air, when it quickly becomes pulverised, especially after being exposed to frost.

**TEN KINDS OF VEGETABLES FOR EXHIBITION IN JULY:** *Alpha.* Cabbage, Enfield Market; Carrot, Early Nantes or Scarlet Model; Cauliflower, Walcheren or Early London; Onion, from autumn-sown seed, Giant Rocca, a variety of Tripoli or the Queen; Turnip, Selected Early Snowball or Early Milan; Potato, Supreme, Windsor Castle, or Ashleaf Improved; Spinach, Victoria Round-leaved; Pea Gradus, Main Crop, or Stratagem; Broad Bean, Seville Longpod; French Bean, Negro Longpod or Ne Plus Ultra; Beetroot, Egyptian, dark red, turnip-rooted, Leek, Ayton Castle Giant, or London Flag; but the seed must have been sown in heat last month. Of the above twelve distinct sorts of vegetables,

ten may be selected according to fancy, remembering that Spinaoch does not carry much weight in an exhibit of this kind, and that it is early for good Leeks.

**TIGER NUTS:** *T. F., Grappenhall.* The tubers you send are the fleshy root-stocks of *Cyperus esculentus*, a species widely distributed in the warmer parts of the world. It would answer your purpose very well.

**TOMATO PLANTS ROTTING-OFF:** *R. V. H.* The loss of the plants is probably due to lack of lime in the soil, and you should apply superphosphate of lime, and also a weak solution of sulphate of iron to the borders. If wireworm is not very abundant in the soil, the superphosphate may cause most of these creatures to depart; but if numerous, you ought to use fresh soil not infested with them. Above all things do not plant the seedling Tomatos deep in the soil, many plants being lost in the early stages from this cause. When the stem acquires firmness no harm is done by deep planting, in reason.

**VINE FOLIAGE:** *H. K.* The appearances are quite consistent with "scalding," which is most likely the result of your not paying close attention to the ventilation of the vinery in the morning hours.—*C. W. Leyland.* Scalding, probably, by a sudden burst of sunshine striking the foliage when the house was insufficiently ventilated.

**VIOLETS:** *B. A., Warwick.* We can find no trace of organic disease in the Violet roots or foliage. There is a low state of vitality which seems to indicate want of nutrition. The stems are woody, from retarded growth, and all the indications are those of bad surroundings. Why not try removal to a more congenial soil, and better aspect? The growth requires to be stimulated by improved culture. *M. C. C.*

**WINDOW GARDENING JUDGING:** *G. W.* There should be a small entrance-fee required from each competitor; and there should be two main classes, indoor and outdoor window displays; and these again subdivided into pot and box-grown plants, the choice of subjects grown to be left open. There might be a class for specified plants, as *Fuchsias*, zonal, Cape, sweet-scented and Ivy-leaved *Pelargoniums*; *Petunias*, *Musk*, *Ferns* native and exotic; *Cactuses* and *Sedums* in variety, *Ophiopogon Jaburan*, *Begonias*, especially the summer-flowering tuberous-rooted; *B. discolor* and the *Rex* varieties; *Ornithogalum umbellatum*, and other species; *Moneywort*, *Rochea falcata*, *Saxifraga sarmentosa*, &c. If the judging takes place in the spring, the cultivation of Dutch bulbs, *Narcissus*, *Anemone hortensis*, *Triteleias*, *Ixia*, *Scillas*, &c., might be encouraged. If late in the summer, the *Chimney Campanulas*, in blue and white-flowered varieties, should not be forgotten, this plant being one of the best for either town or country windows. Well-grown *Mignonette*, in outside boxes or pots, is another desirable subject. The judging should take place on one day, and the jury consist of three capable persons. For most things it will be advisable to have at the least four prizes; and these need not consist of money, unless the recipient desires to have his prize in that form, but they might consist of any of the following items:—Flower and vegetable seeds of plants of known excellence; of plants, fruit-bushes, or wall-fruit trees (maidens), garden tools, knives, nails and shreds, claw-hammer, a hand-light, flower-pots, &c.

**COMMUNICATIONS RECEIVED.**—*G. J. Ingram.*—*F. Cornish.*—*W. B. H.*—*M. D.*—*J. H. B.*—*Count de K.*—*G. P.*—*H. H.*—*E. M. H.*—*J. W.*—*W. P.*—*H. H. D'O.*—*W. S. P.*—*E. G. B.*—*J. R. CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 90 per cent., and that it continues to increase weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

## LLOYD'S PERFECTED 'Pennsylvania'

AMERICAN  
LAWN-MOWER.

"We strongly recommend the 'Pennsylvania.'" —Field.

World's Fair, Chicago, Highest Award.  
Paris International Exhibition, Highest Award, Silver Medal.  
NO AWARD WAS GIVEN  
to any English or Continental-made Lawn Mowers.

THE "PENNSYLVANIA"  
IS THE  
Perfection of EASY WORKING and  
EFFICIENCY.

The ONLY AMERICAN LAWN MOWER fitted with  
Six Cutting Blades.

THE "PENNSYLVANIA"  
IS THE  
MACHINE

FOR  
GOLF  
LINKS.

Above illustration shows the machine as it appears when OUT OF GEAR, and in the proper position for running it easily from one place to another, over gravel walks or rough and uneven ground. When moving it in this way there is no unnecessary wear of the driving pinions, all risk of damaging the cutting knives is avoided, and the machine can be pushed over the ground with very little labour—a great advantage in extensive gardens, but especially on GOLF LINKS.

Gardeners who have once tried the "Pennsylvania" Lawn Mower, will use no other.

THE "PENNSYLVANIA."  
CARRIAGE PAID TO ALL STATIONS.  
THE "PENNSYLVANIA."  
ONE MONTH'S FREE TRIAL ALLOWED.

TESTIMONIAL—

"World's Columbian Exposition,  
Chicago, October 16, 1893.

"Gentlemen—I desire to state that we have used the 'Pennsylvania' Lawn Mowers almost exclusively during the progress of the Fair, with the most satisfactory results. The ease in working them was remarkable, and they did more work than we supposed was possible for Lawn Mowers to accomplish. The appearance and condition of our lawns, in comparison with others, prove the high grade and superiority of these Lawn Mowers.—A. B. FARQUHAR, Executive Commissioner."

GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. STRATTON, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

# GREEN'S PATENT "SILENS MESSOR" AND "NEW MONARCH"

## ROLLING AND COLLECTING MACHINES FOR 1896.

The Winners of every Highest Prize in all cases of competition, and the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by— They are the first, foremost, and best in the world.  
**HER MOST GRACIOUS MAJESTY THE QUEEN** on numerous occasions,  
**HIS ROYAL HIGHNESS THE PRINCE OF WALES,**  
**THE KING OF THE BELGIANS,**  
 The Late **EMPEROR OF THE FRENCH,** **THE EMPEROR OF RUSSIA,**  
 And most of the **NOBILITY, CLERGY, and GENTRY** of the United Kingdom.  
 most excellent, as is proved by the fact of some of the Horse Lawn Mowers having been in use here for upwards of thirty years; but combined with good workmanship is the further important recommendation that they are of very light and easy draught.

The **Queen's Head Gardener, Mr. OWEN THOMAS,** writing from the Royal Gardens, Windsor, to Messrs. GREEN on January 17, 1894, says:—"I have pleasure in saying that both at Chatsworth and at the Royal Gardens my men have constantly had your Lawn Mowers in use for many years—Horse, Pony, and Hand power—and one and all of these Machines have done first-class work, and given every satisfaction. Not only is the workmanship and material in your Machines of the highest quality, but the manner in which they are put together is of the most perfect kind, and the result is that they are of the most durable and reliable character. I have no hesitation in recommending them to all others."

Upwards of 220,000 of these Machines have been sold since they were first introduced in the year 1856. They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—1st. Simplicity of Construction—every part being easily accessible. 2nd. They are worked with much greater ease than any other. 3rd. They are the least liable to get out of order. 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

### SINGLE-HANDED SILENS MESSOR LAWN MOWER.

With Improved Steel Chains, Wheels, and Handles.  
 To cut 6 in., can be worked by a Lady ... £1 15 0  
 To cut 8 in., do. do. ... 2 10 0  
 To cut 10 in., do. by a strong youth ... 3 10 0  
 To cut 12 in., do. by a man ... 4 10 0  
 To cut 14 in., do. do. ... 5 10 0

We are the only makers of Lawn Mowers appointed by Royal Warrant to Her Majesty the Queen, and His Royal Highness the Prince of Wales.

BEWARE OF DECEPTIVE IMITATIONS.

### DOUBLE-HANDED LAWN MOWER.

To cut 16 inches, can be worked by one man on even lawn ... £8 10 0  
 To cut 18 inches, do. man and boy ... 7 10 0  
 To cut 20 inches, do. do. ... 8 0 0  
 \* To cut 22 inches, can be worked by two men ... £8 10 0  
 \* To cut 24 inches, do. do. ... 9 0 0  
 \* If made stronger, suitable for Donkey, 30s. extra.

These Mowers are the "Ne Plus Ultra" and "Acme" of perfection of all Lawn Mowers extant.

Donkey, Pony, and Horse Machines, including Patent Self-Delivery Box, or Side Delivery, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness.  
 We have dispensed with the old-fashioned method of side delivery in these machines, so that they are thoroughly up to date.

### DONKEY AND PONY MACHINES.

To cut 26 inches ... £14 0 0  
 To cut 28 inches ... 18 0 0  
 To cut 30 inches ... 18 0 0  
 Leather Boots for Donkey ... 1 0 0  
 Leather Boots for Pony ... 1 4 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machine makes little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the machine. Packing Cases as per List, except when for export.

### HORSE MACHINES.

To cut 30 inches ... £22 0 0  
 To cut 36 inches ... 26 0 0  
 To cut 42 inches ... 30 0 0  
 To cut 48 inches ... 34 0 0  
 Leather Boots for Horse ... 1 9 0

### GREEN'S PATENT LAWN TENNIS COURT MARKER (No. 2412).

The Best Marker made.

1st size, with 3 wheels, 14s.  
 Large size for Clubs and Large Grounds, price 17s.

Small Bag of Marking Composition, 6d.

### Green's Patent New Monarch LIGHT DRAUGHT LAWN MOWER.

It is superior to any Mower of this class yet brought out. Very suitable for Small Lawns and Banks.

SIZES AND PRICES.  
 To Cut ... 6 8 10 12 14 16 inches.  
 Without Grass Box ... 30s. 35s. 40s. 50s. 60s. 70s. each.  
 Grass Box extra ... 5s. 5s. 5s. 6s. 6s. 6s. 6s.  
 If fitted with a Long Handle for cutting banks, &c., 5s. extra.  
 No charge for packing cases, except for shipment.

### GREEN'S PATENT Ordinary IRON and WATER-BALLAST ROLLERS

FOR Lawns, Drives, Bowling Greens, Cricket Fields, and Gravel Paths.

PRICES OF	wt. qr. lb.	Diam.	Length.	Reduced Prices
HAND ROLLERS.	2 1 0	16 in.	by 17 in.	£2 5 0
	3 0 0	20 in.	22 in.	3 0 0
	5 2 0	24 in.	26 in.	4 5 0
	8 2 0	28 in.	30 in.	5 10 0
	8 2 0	30 in.	32 in.	7 5 0

### GREEN'S IMPROVED WATER & SAND BALLAST ROLLERS.

IN TWO PARTS.

They can have the weight regulated to suit the requirements of the ground, and also have it increased up to 45% on the empty weight of the Rollers.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in Great Britain.

PRICES INCLUD- ING WATER FUNNEL.	Weight—wt. qr. lb.	Diam.	Length.	Reduced Prices
3 1 0	18 in.	18 in.	by 17 in.	£3 0 0
	20 in.	20 in.	22 in.	4 0 0
	24 in.	24 in.	26 in.	5 5 0
8 2 0	28 in.	30 in.	32 in.	7 0 0
	30 in.	32 in.	34 in.	9 5 0

These Rollers possess many advantages over all others; they are made in two parts, and are free in revolving on the axis, which affords greater facility for turning, and the outer edges are rounded off or turned inwards, so that the unsightly mark left by other Rollers is avoided. They are manufactured of the best materials, bored true in the lathe, turned on the inner edges, fitted on polished shaft, and are set up in a manner surpassing any hitherto brought out.

### GREEN'S IMPROVED PATENT GRASS EDGE CLIPPER. THE "HANDY."

The work it does is clean, neat, and effective, and we have every confidence in recommending this useful "Handy" implement. It is fitted with long handle, works steadily and with ease.

Price, 30s.

Carriage paid to all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland. The largest stock of Mowers kept by any manufacturer is to be found at our London Establishment, SURREY WORKS, BLACKFRIARS ROAD, where Purchasers can make selection out of several hundred Machines of Hand, Pony, and Horse Power, and have their Orders supplied the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, Free of Cost to the Purchaser.

N.B.—Those who have Lawn Mowers which need repairing should send them either through their Ironmonger or Seedsman to our Leeds or London Establishment, or direct to us, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

GARDEN SEATS AND CHAIRS, AND HORTICULTURAL IMPLEMENTS OF EVERY DESCRIPTION, WIRE NETTING, &c., &c. Descriptive Illustrated PRICE LISTS Free on application to

**THOMAS GREEN & SON, LIMITED, SMITHFIELD IRONWORKS, LEEDS; AND SURREY WORKS, BLACKFRIARS ROAD, LONDON;** or they can also be had of any respectable Ironmonger, Seedsman, Merchant, or Factor in the United Kingdom.

"Paxton's Calendar," New Edition, "The Cottagers' Calendar of Garden Operations," Price 3d.; post-free, 3 1/2d. 41, Wellington Street, Strand, London, W.C.

**CANNELL'S STAR OF HONOUR, OPEN TO KENT, SURREY, AND SUSSEX.**—The winner of the above distinction immediately returns, and is for ever known as a first-class producer of Fruit, Flowers, and Vegetables. The competition takes place at the Great Show, Sevenoaks, on August 12 next, and we believe for the first time in history, the second and third men are awarded prizes, thus stimulating the whole establishment into higher exertions to win, and also to make gentlemen's gardens more productive, interesting, and attractive. SWANLEY, KENT.

**TESTIMONIALS.**

Hurlingham Club, Fulham, June 13, 1895. I have used your Lawn Mowers for over twenty years, and find them the best. The addition of Springs is a very great improvement. (Signed) WM. SUTHERLAND, Head Gardener.

Ranelagh Club, Barnes, S.W., Oct. 13, 1895. On behalf of the Committee, I have pleasure in stating that your Mowing Machines fitted with Patent Steel Springs have been used for six months on our Golf Links and Polo-Grounds, and have given the greatest satisfaction. The Springs, in our opinion, are a great improvement in Lawn Mowers.—Yours faithfully, (Signed) HENRY E. RIDLEY, Assistant-Secretary.

58, Dawson Street, Dublin, Nov. 1, 1894. Referring to the Horse Machines supplied last season, Mr. J. Robertson, Land Steward to the Right Hon. Earl Fitzwilliam, writes us as follows:—I have great pleasure in stating that the Horse Lawn Mower has done its work exceedingly well. The Patent Springs fitted to the main axle are a great advantage, especially when the ground is uneven, as they prevent jolting and vibration of the machine.—Yours truly, (Signed) W. DRUMMOND AND SONS.

(Per BEN REID AND CO., of ABERDEEN.) The "CALEDONIA" Lawn Mower made by Shanks, Arbroath, is one of the best I have ever tried. I got a 14-inch size, and it is undoubtedly the lightest and sweetest-working Mower in my collection. (Signed) JOHN M. TROUP, Gardener to H.M. the Queen, Balmoral.

THE

**Gardeners' Chronicle.**

SATURDAY, MARCH 28, 1896.

SOME OLD "BOTANICAL MAGA-  
ZINE" WRAPPERS.

READERS interested in the history of bota-  
nical and horticultural literature may,  
perhaps, remember my condensed account of  
*Curtis's Botanical Magazine*, which appeared in  
the *Gardeners' Chronicle* in 1887, when the pub-  
lication in question had reached the hundredth  
year of its uninterrupted existence. As I then  
stated, the history of the *Botanical Magazine* was  
the history of flower gardening in this country  
during this long period, and I incidentally  
mentioned some interesting facts gleaned from  
two or three old covers of monthly parts that  
came under my notice. It is probable that  
many of these old wrappers, as they are techni-  
cally termed, still exist, but at the same time  
there is no doubt that they are comparatively rare,  
because most persons had their copies bound,  
and few persons realised the importance of pre-  
serving the wrappers on account of the adver-  
tisements, announcements, and even occasional  
corrections that appeared on them, and nowhere  
else in the work. Now-a-days, in a well-  
ordered library, all wrappers containing infor-  
mation not repeated in the work itself are  
preserved, although at the time of issue this  
matter may be of the most trifling interest.  
But this by the way. Kew is indebted to Mr.  
F. W. Burbidge, the Curator of Trinity College  
Botanic Garden, Dublin, for a set of the wrap-  
pers, and appended advertisements of various  
kinds, of volumes 30, 31, 32, 40, and 43, of the  
*Botanical Magazine*. These volumes appeared  
between 1809 and 1816, at a period when garden  
botany and pictorial publications connected  
therewith were in a highly flourishing condi-  
tion; and some of the facts relating thereto to  
be found on these old covers may be of sufficient  
interest to repeat here. What strikes one very  
forcibly is the number and high price of the  
numerous illustrated works then offered for  
sale. Prominent among these are Thornton's  
works, some of which I described in the *Gar-  
deners' Chronicle* for July and August, 1894. I  
pointed out there that it was difficult to ascer-  
tain what was issued by Thornton under a given  
title, and at what price, as I had seen no two  
copies exactly alike in what they contained.  
An advertisement in the *Botanical Magazine* for  
1809 affords some interesting information on  
these points. "The Temple of Flora," "A  
New Illustration of the Sexual System of  
Carolus von Linnæus," and "The Philosophy of  
Botany," are offered at twenty pounds each,  
and an issue in monthly parts, at a guinea  
a part, is also announced. The admirably-  
executed portraits of botanists mentioned in my  
article referred to, are described as forming  
part of the *New Illustration*. The advertise-

ment also confirms my suspicion that the author issued plates and letter-press in various combinations and under different titles. For example, the title given in the *Gardeners' Chronicle*, July 28, 1894, p. 90, is quite different from any one of the three in the advertisement, and the superb volume to which it belongs is manifestly a combination of *The Temple of Flora* and *A New Illustration*.

In the same year (1809) Philip Miller's *Figures of Beautiful, Useful, and Uncommon Plants* is announced, without any reference to the original edition (1755—1760). It was to be published in sixty parts, at 7s. 6d. a part, whether it actually came out I have not ascertained; but it is not mentioned in any of the bibliographies to which I have access.

Professor Martyn's edition of Miller's *Gardeners' Dictionary* is offered in the same place for 14 guineas; so that these two works would cost no less than £37 4s. Woodville's *Medical Botany* is priced at £8 5s. Samuel Curtis's edition of Maddocks' *Florists' Directory*, a small octavo, with eight coloured plates, cost £1 1s., or on large paper £1 11s. 6d. Among other books announced at this date were Lee's *Introduction to Botany*, fourth edition, by James, son of the author of the original edition (1760), and founder of the Vineyard Nursery at Hammersmith; Colin Milne's excellent *Botanical Dictionary*, third edition; Curtis's *Lectures on Botany*, and the same author's *Practical Observations on British Grasses*, to which was appended *A Short Account of the Cause of Diseases in Corn*, by Sir Joseph Banks—the only botanical work he ever published, I believe. Robert Brown's *Prodromus Floræ Novæ Hollandiæ* reminds us of the prodigious strides in science made by our Australian colonies in recent years.

Haynes's *Interesting Discoveries in Horticulture*, a treatise on the propagation and cultivation of plants generally, cost three guineas and a-half, and could therefore not have been within reach of many gardeners. The prospectus of an illustration of the classes and orders of the Linnean system of Botany announces the publication in octavo of a work to cost £7 16s., without author's name. William Salisbury's work on orchards, and Walter Nicol's various publications on gardening, demand our attention. Johnson, in his *History of English Gardening*, describes the works of the latter as of the first authority, though, curiously enough, he does not mention that author's book, *The Forcing, Fruit, and Kitchen Gardener*, perhaps the most important of all. Kew possesses a copy of the third edition (1802), which was once the property of Mr. James Lee of Hammersmith.

But the *Botanical Magazine* of those times was used as an advertising medium for a variety of things, besides botanical and horticultural literature. Samuel Curtis advertised his very extensive stock of Roses; Chandler & Buckingham, of Vauxhall, their Camellias, including "Kew Blush," and Auriculas. Even quacks figure, such as Hubert, with his "roseato powder" to make women beautiful; James Sowerby's advertisement of his "New Elucidation of Colours, Original, Prismatic, and Material," price one guinea, has something of the same ring about it. He professes to show "the means of producing the former as from the sun, the common light, the moon, &c., without the aid of a dark closet, in any given proportion, to measure and mix them with the same effect as material colours, in all their superior brilliancy, equalling the most superb rainbow, with coloured plates, &c." It

seems, too, that he gave practical demonstrations, but was tiring of it, for the advertisement ends with the following intimation: "Those persons desirous of attending the lecture on the subject, which exhibits the colours on a large scale by means of a wedge, 60 feet in length, equal to many rainbows, must send in their names early, as Mr. Sowerby has not leisure to repeat it often, and intends to dispose of the apparatus."

The foregoing extracts form only a very small part of the contemporary associations. Mr. Scott's *Marmion* and *Lay of the Last Minstrel*, splendidly embellished; a beautiful edition of Dr. Watts' *Divine Songs for Children*; three favourite poems, *Henry and Emma*, *The School-mistress*, and the *Dying Negro*; and *A Panorama of Wit*—are a sample of the variety of literary productions offered to the public. W. Botting Hemsley.

## NEW OR NOTEWORTHY PLANTS.

### LIPPIA IODANTHIA

Is the name of a Verbenaceous shrub discovered in the environs of Cuernavaca (Mexico) by Pringle. A woodcut illustration is given in *Garden and Forest*, March 11, p. 105. It is described "as a shrub 5 to 10 feet in height; its small yellow flowers are borne in purple bracted heads, nearly an inch in diameter, and these profusely cover the branches of the plant, making it a lovely object through many weeks of the autumn." According to the figure, the stalked leaves are opposite, lanceolate, serrulate, wrinkled, and the flower-heads are produced at the ends of slender axillary peduncles, exceeding the leaves in length.

### PEREZIA SONCHIFOLIA, Baker.\*

This is a curious and pretty annual or biennial Composite, introduced from Uruguay by M. Ed. André. The root-leaves are long and narrow, sharply lobed and cut, the upper ones sessile or amplexicaul. The white flower-heads measure about  $\frac{3}{4}$  or 1 inch across, and are arranged in loose terminal panicles. Ligulate florets white, overlapping one another, and giving the appearance of a double flower. M. André says the plant may be grown either as an annual by sowing in heat in spring, and pricking-out later on, or as a biennial by sowing in the open air in autumn, in which case the protection of a frame is necessary.

### NEW CACTI.

In the *Bulletin of the Muséum d'Histoire Naturelle*, n. 8, M. D. Bois mentions certain new or noteworthy Cacti introduced from Lower California, viz.:—

*Cereus Camouglit*.—A dwarf shrubby species, with diffuse branches bristly with spines; the fruit is said to have an agreeable flavour.

*Cereus Digneti*.—A species with tuberous roots, from which rises a single slender branching stem, resembling a dead stick, the young shoots being green. The flowers are white, and open at night; fruit red.

*Echinocactus Peninsulæ*.—An "enormous" species, 7 or 8 feet in height, stem ovoid or club-shaped, traversed by twelve to twenty ribs; spines red, with a yellow point; flowers reddish externally, yellow within.

*Opuntia Alcaches*.—The stems are cylindrical, much branched; spines slender; flowers greenish-yellow; fruit sub-globose, spiny, deeply umbilicate.

*Opuntia Cholla*.—Also a South Californian species, with cylindrical much-branched stem; spines radiating; flowers rose-coloured; petals lanceolate. Fuller details are given in the February number of the *Journal of the Société Nationale d'Horticulture de France*, p. 226.

\* *Perezia sonchifolia*, Baker, in *Flora Brasiliensis*; André, in *Revue Horticole*, March 16, 1896, p. 134, c. ic. color.

## ORCHID NOTES AND GLEANINGS.

### ONCIDIUM SARCODES.

MR. ERNEST A. TUCKER, Vernor Lodge, Preston, Brighton, sends a sketch and particulars of a fine *Oncidium sarcodes*, which is noteworthy. Mr. Tucker says: I have a plant of *Oncidium sarcodes* now in flower in my Orchid-house, with 176 flowers fully developed and open. The main stem of the flower-spike is about 8 feet long, and has numerous branching spikes varying from 1 to 3 feet in length. I shall be glad to know if this is an unusually large inflorescence. [It is. Ed.] The flowers of my plant are very bright yellow, not much blotched with chestnut brown.

### ORCHIDS AT OAKWOOD, WYLLAM, NORTHUMBERLAND.

To be able to say that quite 90 per cent. of the plants forming the collection are from seeds, cross-fertilised, and raised on the place, is an experience unique in the history of Orchid culture. It is a fact that the Orchid establishment of Norman C. Cookson, Esq., more than bears out the assertion, incredible though it may seem to those who have not watched the development of Mr. Cookson's interesting and scientifically-worked hobby, the raising of hybrids and crosses of Orchids which shall not only be different from anything in cultivation at the present day, but also distinct gains to gardens; or who have not seen the result of his labours and those of his careful gardener, Mr. Wm. Murray, when these have been exhibited at the Royal Horticultural Society's meetings, where they seldom fail to secure high honours.

In passing through the neat block of Orchid-houses, which are span-roofed with the exception of the *Odontoglossum*-house—a lean-to, several salient matters command attention, and chief amongst these is the clean, healthy condition of the plants, both parents and offspring, in all stages of growth; the coolness of the temperature maintained, and the well-ventilated condition of the houses; the rapid strides which the seedlings make from the first tiny pseudo-bulb to the mature-flowering growth, and the extraordinary floriferousness of the plants. Much of the success in maturing good seeds, raising the plants, and afterwards flowering them quickly, is attributed to the careful ventilation and heating of the houses.

In the matter of heating, the houses are furnished with plenty of 4-inch piping, which secures the desired temperature without driving, even in very cold weather; and it may be said that hot-water pipes are never allowed to get hot—only warm. In some of the houses an overhead hot-water pipe (which Mr. Cookson and most other Orchid-growers consider a pernicious innovation unless very carefully managed) is run just under the eaves of the roof, and some good is got from it by allowing the heated water to circulate in it late at night when the weather is very cold and frosty, turning it off early in the morning. This arrangement of pipes is not used for the purpose of raising the temperature, but to prevent the condensation of moisture and the consequent drip when the weather is very cold outside.

In all the houses the staging consists of close, flat tables covered with broken coke (not gas coke), which is excellent for the purpose, as it takes up a large quantity of water, and is a good evaporator. Above these is open wooden trellis-work staging, on which the plants are placed. The smallest seedlings are put in suitable small pots, which are secured fifteen or twenty together in shallow pans. Hard upon 14,000 home-raised seedling Orchids are to be found at Oakwood, and about them and their habits many interesting particulars can be gleaned, some of which confirm and others confute popular notions. For example, it is a common thing to hear that Orchids are killed or much debilitated by seeding and yet Mr. Cookson's experience is that if properly looked after, the parent plants need suffer but little even in the case of subjects reputedly difficult to manage—and not at all, so far as the general run of Orchids is concerned. In support of this he

shows many instances—two of the more remarkable being the plant of *Dendrobium McCarthiae*, which he has had for fifteen years and repeatedly seeded; and one of *Phaius tuberculosus*, of the first importation, which has borne fruit several times, the last occasion being in January, 1895, and yet the plant is in good health, flowering again, and again destined to bear seed. These hybrid *Phaius* are considered to be among the most satisfactory of hybrid Orchids, and a great show is now formed by those which are in flower. The original plant of *P. × Cooksoni* has nine fine spikes of flowers; and a companion plant is in use in the drawing-room, where it will last a longer time than in the Orchid-house, and be rather benefited than otherwise by the change—at least, that is the experience at Oakwood. In the new hybrid between a fine form of that noble and distinct plant known in gardens as *Phaius Sanderianus* and *P. tuberculosus*, and of which there is a thriving batch, the highest point of excellence will

original *D. × chlorostele*. The favourite class of the *D. × Cassiope* type here are charming flowers, and the newer hybrids far surpass the original in size and beauty, but still retain its floriferous character. Two of the best of this class are *D. × Doris* and *D. × Cassiope virginale*. The hybrids having an affinity to *D. × Ainsworthii* also make a splendid show, and are all the more attractive owing to the endeavour made to get away from the uniformly pale rose-tinted flowers of the old type, into varieties with richly-coloured or with pure white flowers. One of the most beautiful of the whites is *D. × Leechianum album*, a large flower, pure white, with a clear purple base to the lip; and of the coloured *D. × Dulce*, Oakwood variety, a fine thing, with pure rose-pink tinted flowers, and dark base to the labellum. A very interesting incident in cross-fertilising Orchids is seen in the very fine display of blooms on a large batch of home-raised *D. nobile* obtained by crossing *D. nobile nobilium*, and the tri-

very free to grow and flower, the plant having borne over fifty of its fine richly-coloured blooms at a time. Among crosses flowering for the first time, the most distinct and remarkable is *D. × Murrayi var. D. nobile* ♂ and *D. albo-sanguineum* ♀. It has a very large and perfectly formed wax-like, white flower, the base of the lip of a rich purple colour, and its apex soft primrose. It is altogether unlike any hybrid previously flowered, its stout pseudo-bulbs showing more of *D. albo-sanguineum* than the flowers.

In the next range in the first division are some specimens of *Phalaenopsis* and some rare *Cypripediums*, among which are two plants of *C. callosum Sanderæ*, the colourless callosum, which is in its class as *C. Lawrenceanum Hyeannum* is to its species. These it is intended to raise true, and already the attempt on *C. Lawrenceanum Hyeannum* is being proved, the first to flower being just about to expand, and is evidently true. In the next division are the small seedlings of new crosses in *Dendrobiums*, in

FIG. 51.—FREESIA REFRACTA (TRUE). (SEE P. 392.)

FIG. 52.—FREESIA ALBA. (SEE P. 392.)

probably be attained until some fine new importation induces some cross breeder to traverse the field once more.

In a garden where the raising of new varieties is the chief concern, one might expect to see a number of plants seeding, but perhaps not more than ten or a dozen met the eye; and here, too, we find Mr. Cookson's experience differs from that of other raisers who obtain an extraordinary large number of fructified ovaries, and but a very few seeds capable of germinating. This gentleman considers that nine-tenths of his seed-pods give satisfactory results, and the explanation of this is, that nothing is done at random—that he and his gardener work intelligently, and watch the nurselings constantly.

The show of flowers at present at Oakwood is chiefly made by the home-raised *Dendrobiums*, which make a brilliant display in the first division of the span-range devoted to them. Among them are many varieties of the hybrid here raised between *D. Linawianum* and *D. Wardianum*, the largest and richest in colour, and with a labellum closely approaching that of *D. Wardianum*, being known as *D. × Owenianum*; while the paler and least showy crosses are identical with the

labelloid *D. n. Cooksoni*. In the progeny, all of which bear very fine flowers, no two are alike. A few are identical with *D. n. Cooksoni*; and there is among them another charming novelty, *D. nobile Arnoldianum*, which is in the same way, but with lower sepals normal in form, but marked with dark purple on the lower halves. A few are richly coloured like *D. nobile nobilium*; one is a fine white, near to *D. n. Schroderianum*; and all the forms and all the shades of colour are represented. If a single pod of home-raised seeds gives such variety, need we wonder at the variation in imported plants, which forms a great factor in preserving the interest in Orchids.

*D. × Sybil* (*Linawianum* ♀, *higibbum*), of which there are several in flower, is one of the brightest and most distinct of hybrid *Dendrobies*. *D. × Bryan* (*Inteolum* ♀, *Wardianum*), a charming thing, with large soft yellow flowers, barely showing evidence of the colours of *D. Wardianum*; *D. × Astrea* (*Inteolum* ♀, *crassinode*), a very singular and pretty yellow flower, with slate-coloured tips to the segments; and *D. × Venus* (*Falconeri* ♀, *nobile*), one of the most gorgeous of known *Dendrobies*, and here in its home

which *D. Brymerianum*, *D. McCarthiae*, and others likely to produce distinct things, are much employed.

The next is a *Cypripedium*-house, in which many crosses will shortly be proved, and what is perhaps of more consequence than some of them will be a small batch of true *C. insigne Sanderæ*, and some other rare varieties which are coming on from seeds. A fine form, too, of *Dendrobium atroviolaceum* is in bloom, which is set aside for stud purposes. At the entrance to the house containing the almost innumerable little plants of hybrid *Cattleyas*, *Lælias*, and *Lælio Cattleyas*—perhaps the most surprising and interesting feature in the Oakwood collection, which, like the rest of the Orchids here, are kept tolerably cool, is a batch of sturdy vigorous plants of *Phaius Humboldtii*, almost bursting their pots with roots, and which afford a capital instance of the value of observation. Knowing that the plant came from Madagascar, it was at first put into a hot, moist house, but this kind of treatment proved unsatisfactory, and it was removed to a comparatively cool house, where it soon gained in vigour, and now grows and flowers very freely.

Among the nurselings, the Indian yellow *Lælio-Cattleya × Doris* is in flower, and others which have

not yet been seen in flower are about to bloom; but, as their enthusiastic owner says, "It needs not flowers to keep alive the absorbing interest and pleasure of those under whose hands these things have grown from the time they were first seen by the aid of a lens, although it is a red-letter day when any one of them flowers for the first time."

In the lean-to Odontoglossum-house, seven rows of 4-inch piping keep up a genial temperature, and the plants thrive admirably. In raising these plants there is not the good rewards as in the other genera, although Mr. Cookson has some hybrid Odontoglossums coming on, and notably two or three stout plants, the result of crossing *O. crispum* Cooksoni and *O. Halli leucoglossum*. The great success with the Odontoglossums here is by propagation of rare varieties by division. As an instance of this may be cited the fact that the plant of the fine *O. crispum* Cooksoni has now been multiplied into seven; and *O. c. Sandere*, *O. × excellens* "Princess Christian," and other priceless varieties have also been increased in number. Here also are some fine hybrid *Masdevallias*; a beautiful new cross between *M. Veitchii grandiflora* and *M. Harryana cœrulescens*, having a large brilliant orange-scarlet flower, with rays of mauve coloured papillæ. At the door is a simple arrangement for keeping the place cool in hot weather, viz., a curtain over which water slowly trickles from a cleverly-constructed overhead tank.

Many clever contrivances, the invention of Mr. Cookson, who is a skilful engineer, no doubt contribute to the well-being of his Orchids, the tender seedlings among which are likely to vanish at the least reverse. One of the most salutary of these is his method of keeping down insects, by spraying with tobacco-water treated by boiling with lime, and then precipitated with carbonate of ammonia. This preparation leaves not a trace of dirt or deposit of any kind, but effectually destroys all insect life. The spraying is done in the afternoon on a falling temperature, and so finely is it distributed, that the atmosphere of the house resembles a dense fog.

Another useful appliance for propagating *Dendrobis*, &c., is a wirework couch, partly filled with sphagnum moss, and fixed in a healthy part of the house under the staging and above the pipes. Here portions of pseudo-bulbs of things desirable to propagate are placed, and with invariably good results. But turn where we may, we see evidence of skill and forethought — of just those qualities which here bring pleasure and satisfactory results, and the lack of which is often the cause of failure at all points, even in gardens where more money is laid out. The Orchids at Oakwood have to share with hardy herbaceous and alpine plants, hardy bulbs, Carnations, &c., the favour of their owner, and a splendid display of these plants is to be found in the large garden which surrounds his house.

### SOME FINE FREESIAS, AND OTHERS.

ALTHOUGH I have grown these beautiful and most fragrant spring-blooming bulbs ever since their introduction into cultivation by Herr Max Leichtlin, of Baden Baden, now many years ago, never before have I had such a profuse and beautifully abundant crop of flowers on my plants as this spring. I do not attribute this fine bloom to any special method of culture, but rather to the fact that my bulbs though treated in a precisely similar manner in the autumn of 1894 and spring of 1895, hardly flowered at all last spring, but were apparently taking a season's rest, and have now thrown into this flowering the concentrated vigour of two seasons' growth and nourishment. As on a previous occasion when this took place, I found that the bulbs had increased both in size and number on being potted in the autumn, though they had made hardly any foliage and scarcely any bloom. Some of the finest and most distinct of my flowers are depicted in the accompanying woodcuts, the variety Fig. 54, p. 397, is what I grow under the name of *F. Leichtlini major*, and was, I believe, sent out some years ago by Messrs Sutton, of Reading. This has quite superseded the ordinary and much smaller *F. Leichtlini*. Fig. 55, p. 397, is a much

newer and very beautiful and free-blooming form, received some three years ago from Messrs. Dammann & Co., of Naples, under the name of *F. odorata lilacina*; it is an extremely upright piped flower, with a distinct lilac shading suffusing the lower portions of the tube and petals. I received from the same firm with the last-named variety, one named *F. tricolor*, which though distinct in form is, I think, inappropriately named, as there is nothing about its colouring to deserve the name, and which might be more correctly described as *Alba prima*, as the flowers are a pale primrose colour, with the upright standing form of *F. alba*. Fig. 52 is what is generally but incorrectly known as *F. refracta alba*, as it has no title whatever to the name *refracta*, which belongs to a totally distinct and little known species to be described hereafter. The correct name of this species is therefore *F. alba*. Fig. 51 is the exceedingly curious and scarce, but by no means beautiful, *F. refracta tricolor*, which was figured long ago by P. J. Redouté in his splendidly illustrated work, entitled *Les Liliacées*, on the 419th plate of the seventh volume, under the name of *Gladiolus refractus*. Its flowers are much smaller in size than the others, and are of a greenish ground colour, with orange markings on the lip. It will be seen from the woodcut how curiously twisted the flowers are on the spike. I am indebted for bulbs of this curious and rare species to my friend Prof. Michael Foster, F.R.S., of Cambridge, who kindly gave me a few bulbs of it when I visited his most interesting garden in the summer of 1887, which, though grown carefully each year ever since, have never bloomed till now. The foliage of this species is much narrower and of a much deeper shade of green than any other *Freesia*. In form and size of flower the last named sort comes nearest to the only other distinct *Freesia* known to me, *F. aurea*, which I received many years ago from Messrs. Henderson, the once well-known nurserymen of St. John's Wood. Its flowers are of a deep golden self, and are quite scentless, and it is a shy and uncertain bloomer, not coming into flower till all other sorts are over. *W. E. Gambleton, Belgrove, Queenstown.*

### INTERDEPENDENCE OF PLANTS AND ANIMALS.

WE take the following from Mr. Rodway's delightful and valuable book *In the Guiana Forest*.—One day in passing along a creek, we had an experience which set us a-thinking. We were collecting Orchids, and up in a tree overhanging the water was lodged a great clump of *Oncidium altissimum*, its long graceful flower-stems loaded with yellow butterfly-like blossoms hanging over in every direction. It was a magnificent plant, fully 4 feet thick, with panicles rising to a height of 12 feet. It is needless to say that we wanted it for our collection, and that we sent one of our boatmen to fetch it down as carefully as possible. This, however, was easier said than done, for, first, it was attached to the tree; then it was threaded, as it were, with a number of bush-ropes; and finally, more or less entangled in a crowd of branches. Taking a cutlass, the negro climbed up to its level and began to chop at the obstruction, but almost immediately came down with a run, rubbing his hands and face, and picking a swarm of ants from his clothes. Looking up we could see that the attack on the plant had brought out its garrison, which blackened every leaf and flower-stem, and made the negro descend in such hot haste. We will not go into details as to how we procured the plant at last, but only mention that the ants kept us at bay for fully half an hour before we could throw it into the stream. Then came the work of getting rid of the virulent insects by pushing the whole mass under water with a long bamboo, and keeping our bateau up stream to prevent their coming on board. As the roots became soaked, the creek became covered with black patches, and it was quite a work to keep them from running along the Bamboo.

Presently, however, several larger forms were seen swimming in the water, and these turned out to be

cockroaches, which also went floating down with the ants. But we had not yet dislodged all the occupants, for soon a large centipede was seen struggling in the crowd, and, as may be supposed, we did not hurry to take in the plant until sure that this was the only one of its kind harboured by the *Oncidium*.

One of the party suggested that this was 'a happy family,' but we could hardly agree with him if he meant that they dwelt at peace with each other. To us it brought up the great problem of the dependence of plants upon the natural elements, of animals on plants, and these again on other animals. By means of the soil, water, air, and light, the forest tree rose beside the creek, and up it had grown the elegant *Bignonia*, whose flowers were hanging so gracefully far overhead, and whose stems stretched like cords from base to summit. On a fork of the tree, and among the bush-ropes, the Orchid had found a congenial habitat, where it grew and flourished for years, developing a great mass of roots to be occupied by the immense horde of ants. The plant might perhaps have lived without such tenants, but it is most probable that its flourishing condition was mainly due to these little creatures. For they were there with consent, and in return for house accommodation, undertook to keep off the enemies of the Orchid, of which the cockroach was one of the most inveterate. Why, then, were these pests allowed to be present? We can only suppose that the attraction of the plant drew them, and that they had not yet been captured. For it is not to be supposed that even this omnivorous insect will be deterred from attempting to get a delicious meal simply because its enemies are in the fore. Again, was not that one of the reasons why the ants were so ready to take up their abode among the Orchid roots? Where its food was to be found the cockroach would certainly come, and the ant as certainly find its prey. And what shall we say of the centipede? Like the ant, it loves a fat cockroach, and was present in hopes of finding one.

We might carry this example of interdependence still further, although the other developments did not come so immediately under our notice. The tree was an etabally (*Vochysia*), and far above us exhibited a glow of yellow from its being literally covered with golden blossoms, over which were flitting hundreds of sulphur-coloured butterflies, hard at work sipping nectar, and at the same time carrying on the grand work of fertilisation. The tree is a conspicuous object from a long distance; the butterflies are attracted to it in hopes of procuring food, in sipping the nectar they fertilise the flower, and thus enable the etabally to procreate its species. Then it might easily happen, although we cannot say that it did in this particular case, that the first stage in the life of the insect was passed on the same tree. The butterfly sips the nectar, and then deposits its eggs on the under surface of the leaves, from whence come a host of larvae to spread devastation all around, perhaps leaving the tree almost bare. But this is little more than a rough pruning, which causes it to flower all the more freely, and produce a greater supply of nectar for the perfect insect.

Advancing another step we see that the seed produced through the medium of the butterfly attracts birds and monkeys in the day, with bats above and rodents beneath at night, those above playig have among the branches, quarrelling and fighting with each other for the fruit, and dropping them by thousands to feed the nocturnal prowlers. Fioding the tree so convenient the birds pair, build their nests and bring up their young upon it. Now for another aspect: the host of caterpillars bring a crowd of insectivorous birds, which also make themselves at home in the midst of such a grand feast. These are accompanied by a host of flies which have scented their prey from afar, and now come to help carry on the work of preventing the larvae from going too far; and because the flies are there, the goatsucker comes hovering round at night. Unlike the birds, however, the flies do not kill outright, but, as it were, take possession of them for the benefit of their offspring. Piercing the skin of a larva they deposit their eggs underneath, so that when they hatch the young have

free range of their host, and eat up everything but what is then the membranous covering of a pupa.

Now we come to a further aspect of this interdependence. Hawks soar overhead, and hearing the loud chatter of parrots and other birds, now and again pounce down, and drive them to hide in the densest part of the canopy of foliage. But even here they are met with a new misfortune, for snakes have climbed from below to get their share of the good things, and are ready to pounce upon them as they flutter away from the hawk. Down below, in the lower branches or on the ground, the jaguar, puma, or ocelot, lies in wait, and he also lives because that cloud of yellow butterflies gambolled about the flowers a few months ago.

Besides all these the seeds and fruit of forest trees go to feed the shoals of fish which make their way from the great rivers, and swim about everywhere during the flood. On account of their presence, the great jabiru, or giant stork, frequents the inundated tracts, and vies with the alligator and the Indian for a share of the finny spoil.

We might go on further, and tell of the weevils which bore into the fruit as it lies on the ground, of the cockroaches and great beetle larvae with their parasites, and of the ants and scorpions which hunt these, and of the thousand animalcule which also obtain their share of what Nature has lavished so freely. All these get their fill, and yet there are always more seeds left than can find room to grow.

(To be continued.)

### VIOLET PRINCESS OF WALES.

THIS is a Violet of French origin, with very large flowers for a Violet, strongly fragrant, a vigorous tufted habit, and ample leafage. Messrs. H. Cannell & Sons, Home of Flowers, Swauley, and Mr. Owen Thomas, Her Majesty's gardener, Frogmore, showed this variety at a meeting of the Royal Horticultural Society, at Westminster, last year, receiving an Award of Merit for it. The flowers (fig. 53), which have petals above the ordinary size, and of much substance, are of a pleasing shade of blue, and on account of the length and strength of the peduncle, it will be a great acquisition to florists and bouquet makers. Our specimens were supplied by Messrs. Cannell.

### INSIDE GRAFTING.

(Continued from p. 295.)

RESUMING the article on above useful method of propagation, it may be said that it may, within a wide limitation, be practised all the year round, but the time of maximum success will be when the subject under treatment is approaching its growing period, with the sap in a condition to build up what is called growth. This season the cultivator hastens by artificial heat, but it stands to reason that immediately after this is completed, it would be hurtful to again excite the plant to further effort. It is, therefore, safer to limit the practice to the winter and early spring months, taking the first period for subjects that shed their leaves in the autumn, while the early part of the year and spring is held in reserve for evergreens and Conifers, by which term I indicate all the Pine and Fir tribe, as well as Cedars, Cypressess and Yews. The finely-coloured and golden forms of Cupressus, Juniperus, and the so-called Retinosporas now so much used in the best gardens for winter bedding, may be rapidly and easily increased thus, so I feel that many gardeners may like to learn the best methods.

Rhododendrons, evergreen Kalmias, Skinmias, Clethras, and Andromedas require a somewhat different treatment to Aucubas; they and the Arbutus had better be increased by side grafting. Taking the grandest of all flowering evergreens first, the Rhododendron is a most facile subject, the stock used is that known as *R. ponticum*; but if the gardener will search around his old Rhododendron beds, he will doubtless find numerous seedlings growing between and around his old plants, and these lifted with a small ball of earth in the autumn, and hard potted in a mixture of peat and a little sand, will be found to make very good stocks.

It is better, however, to grow these for one year plunged as directed for the Manetti stock, as the better established they are the more assured is success, but it is rarely necessary to turn them in the bed, as like all the Heath tribe (*Ericaceae*), they make fine fibrous roots, which seldom get away from the pot into the plunging material, unless it be into the surface-soil, which is of little moment. Bringing a few stocks into the propagating-pit when the buds "plump up," one can begin to use them. Select your stock, corresponding in size to the graft you wish to put on, cut out from this half through a piece 1 inch or more long on the mature wood, but close up to the growing shoot, and then cut your scion with one or two buds accurately to fit this, binding it in tightly with budding-cotton or raffia. Smear over the union with clay-mixture or grafting-wax, and plunge the grafted stocks into gentle heat, keeping them close under the inside lights, shading from

*vice versa*, which seems to corroborate this view. More will be said concerning this highly ornamental tribe under the head of "Layering and Inarching in the Open." It has been said, and there may be some truth in it, that evergreens grafted or budded on deciduous stocks, shed their leaves, but this is not proved. Here is a problem for those of an experimental turn. Experience.

(To be continued.)

### THE EFFECTS OF FROST ON PLANTS.

FROSTS are generally classified in three groups. We have (1) Early frost, which occurs in autumn before the growth of plants has been completed; (2) Winter frost, during the period of vegetative inactivity; (3) Late frost, which occurs in spring or early summer, after plants have resumed growth. The early and late frosts, coming as they do at a time when plants are unprepared to resist them, cause most damage, and for the most part it is frost in spring or summer, rather than frost in autumn, that the forester has to fear.

The way in which a young succulent shoot or leaf is affected by frost may be briefly described. Like all vegetable tissues, a shoot or leaf is made up of small microscopic chambers called cells, and these consist of a thin membrane which encloses protoplasm—the essential constituent of a living organism—and cell-sap, which is a watery solution of various sugars, salts, &c. In certain parts of shoots and leaves, the cells are not in contact with each other on all sides, like close-fitting bricks, but are only in contact at certain points, like eggs in a basket, or marbles in a jar. The open spaces between the cells are known as intercellular spaces, and in a normal state of the plant they only contain air. When the temperature of such a plant-tissue falls ever so little below 32° F., the cells are induced to part with some of the water which they contain; and this water, passing through the cell walls, becomes converted into ice in the intercellular spaces. The solution of cell-sap in the cells themselves is not frozen because, being a solution, it does not freeze at 32° F., but only at a somewhat lower temperature. As the temperature falls further and further below the freezing-point, more and more water is abstracted from the cells and converted into ice; and, of course, the more water is withdrawn from the cell-sap, the stronger does the remaining solution become, and the lower falls its freezing-point. This abstraction of water from the cells results in an important change occurring in the cells; for whereas at first they were quite full of protoplasm and cell-sap, and their walls distended like an inflated balloon, the distension is relieved by the loss of water, and the cells shrink somewhat and assume the condition of a balloon that has partially collapsed. In their distended state the cells are said to be turgid; in their shrunken condition they are said to be plasmolysed. Now, whereas a young succulent leaf or shoot with all its cells turgid is able to hold itself erect, it will become limp and drooping when the turgidity is replaced by plasmolysis. It is owing to this cause that the young leaves and shoots of plants drop or become prostrated under the influence of frost.

So long as the frost continues, the condition of shrunken cells and ice in the intercellular spaces will be maintained; but what will occur when the temperature rises above the freezing-point will depend very much upon whether the thaw is slow or rapid. It is a well-known fact, that the effect of early or late frost on plants depends not so much on the actual intensity of the frost as upon the character of the morning that succeeds the frosty night. Should the morning be dull and cloudy—that is to say, should the rise in temperature be very gradual—little or no harm may result; whereas should the sun rise bright in a cloudless sky, the worst effects are to be feared. We shall best appreciate the results if we look at the two cases separately. When a frozen plant is thawed very gradually, the ice in the spaces between the cells is very slowly reconverted into water, the

FIG. 53.—VIOLET PRINCESS OF WALES.

direct sun, and occasionally syriaging them. Leave them thus for a month, when the union should be perfect; ascertain that this is so and loosen the tie. In a day or two the plants may be gradually hardened off, brought out into the house, but kept shaded for a time. Use the syringe freely, when a strong growth will ensue, and when this is mature, the young plants may be brought out into a cold house, and in the summer bedded out into the open, or re-potted into larger pots, to be used as pot-plants for forcing or conservatory decoration. The greenhouse Rhododendrons, as they are termed, being mostly hybrids of the Himalayan and Japanese, with other species, can all be grafted on *R. ponticum* or the seedling hybrid stock. The hardy Azalea, too, will do on this stock; indeed, some botanists consider the Azalea and Rhododendron to belong to one and the same genus, probably *R. azaleoides* being the connecting link. We know in practice that some Azaleas will graft on Rhododendron stocks, and

reconversion, in fact, being effected at a rate which enables the shrunken cells to re-absorb their lost moisture and to return to their originally turgid condition. In such a case, frozen plants may not suffer at all, and the frosty night may pass without leaving any appreciable effect.

Very different, however, may be the case where a frozen plant is rapidly thawed. As before, the ice is reconverted into water; but if the change takes place quickly, the cells are unable to re-absorb the moisture, which has thus the opportunity of escaping through the myriads of minute apertures that occur on the surface of leaves and young shoots, and of being lost to the plant. In this case the shrunken cells do not again become turgid, and therefore the affected leaf or shoot, instead of resuming its normal condition, droops limp and lifeless until the plant pushes it off, and it falls to the ground.

In the majority of cases, therefore, plants affected by late frosts die indirectly of drought. If, however, the frost should be very severe, the protoplasm may be affected in such a way as to be completely disorganised, in which case the rate of thawing can make but little, if any, difference to the plant. As a general rule, however, the protoplasm of our hardy plants does not suffer in this way under the influence of spring and autumn frost; that is to say, it is the rate of thawing, rather than the actual degree of cold, which determines the ultimate result. *Dr. Somerville, in "Transactions of the English Arboricultural Society," vol. iii., 1895-96.*

### ORCHID NOTES FROM KEW.

**EULOPHIELLA ELIZABETHÆ.**—This species continues to thrive at Kew, where two plants of it are now in flower, one with two, the other a single spike, the latter bearing forty flowers. It has made good growth in a hot moist position in a tropical pit under the same treatment as has always proved successful at Kew for *Diacrium bicornutum*. Madagascan Orchids are not generally well behaved under cultivation, and the *Eulophiella*, when it first arrived, with its halo of malarial swamps, tree lians, &c., did not look hopeful. It has, however, proved satisfactory so far, and bids fair to remain at Kew for some years. The plants are grown here in baskets suspended near the roof in a steamy atmosphere. They are planted in sphagnum-moss, and receive a liberal allowance of water at the root whilst growing. They make very stout rhizomes and long plaited leathery leaves, but the pseudo-bulbs made here are much smaller than those on the plants when imported.

#### MORMODES HOOKERI.

A plant of this rare and handsome species is now in flower at Kew. It has fusiform pseudo-bulbs 3 to 4 inches long, and a short erect scape, the flowers on which are 2 inches across, the sepals and petals ovate, lanceolate, and coloured reddish-brown; the lip broadly obovate, narrowed to a stalk-like base, the blade rounded with recurved margins, and covered with short velvety hairs, its colour being deep velvety brown-crimson. The column is short, and has the usual twist. The species is a native of Central America. It was first introduced by Warszewicz from Panama, and flowered in the garden of Mr. Llewelyn at Penllergare in 1851, when a figure of it was published in the *Botanical Magazine* under the name of *M. atropurpurea*. Lindley afterwards referred it to *M. barbatum*, but it was renamed as above by Lemaire. The plant now in flower at Kew was received from Mr. R. Pfau, of Costa Rica, two years ago.

#### CYRTOPODIUM ANDERSONI.

A large specimen of this Orchid is now in flower in the Victoria-house at Kew. It has about a dozen pseudo-bulbs, 1 yard or more in length, and 2 inches in diameter at the broadest part. The scapes, which spring from the bases of the new growths, are 5 feet in height, and they bear numerous bright yellow flowers, each about 2 inches in diameter. It is a noble Orchid, not suited for any but a large house, and it requires plenty of heat and moisture. It is sometimes known by the name of *C. cardiochilum*.

According to Veitch this was one of the first tropical Orchids introduced into this country. It is a native of several islands in the West Indies, and also of Brazil, that is, if *C. cardiochilum* is to be included under this species. A plant of the latter form was introduced to Kew from Rio about fifteen years ago, and grew for ten years in the Victoria-house, where it made pseudo-bulbs nearly 5 feet in length, and produced tall branched scapes of flowers. The specimen under notice was presented to Kew by Messrs. F. Sander & Co. W. W.

## CULTURAL MEMORANDA.

### CYPERUS DISTANS.

This is a very useful plant, found in gardens under the synonyms *C. Fletcheri*, *Carex sylvatica*, and others. It has long, bright-green foliage, and umbels of grassy flowers mounted on tall stalks, a very desirable plant for making groups or filling vases and other purposes. It has the recommendation of hardiness, and therefore suitability for use in unheated apartments, standing in a healthy condition in such places for a longer time than any plant I know of. Being a marsh plant, it can scarcely be over-watered if the drainage is not clogged. When grown in small pots, it is a useful plant to employ in the decoration of the dinner-table. It is easily increased by division, potting the rooted pieces in sandy peat and loam, and placing them in a close pit till established; afterwards the temperature of a greenhouse will suit it. *Cyperus alternifolius* and its variegated variety are useful for house-decoration, but they are tender, and soon become unsightly if exposed to a low temperature. B. W.

## THE WEEK'S WORK.

### THE HARDY FRUIT GARDEN.

By G. WOODGATE, *Gardener, Bollington Hall, Burton-on-Trent.*

**FIG TREES** should now be freely exposed, and all winter protection removed, it being unlikely that we shall experience after this date any severe frosts that will cause them damage. If Fig-trees are properly stopped and disbudded during the growing period, very little winter-pruning is required. Such as is needful should be done as soon after the fall of the leaf as possible, the wounds at that time healing quickly; whereas, if left until the spring, the sap has become active, and the branches thus pruned, are very prone to die back. Therefore, at the present time, do no more than cut out the gross and unripened wood, and any of the old fruiting-shoots for which there is not ample space. The fruits, if shaded by a mass of leaves, do not ripen so well as those having the advantage of light and air. If it is intended to increase the stock of trees, some cuttings of well-ripened wood of the previous season's growth, having a heel of the old wood attached, should be taken off before the sap rises. These should be inserted singly into small pots filled with a mixture of cocoa-fibre refuse and sand, removing all the buds from the portion of the stem to be inserted in the soil. Plunge the pots in a propagating-frame, where the bottom-heat can be maintained at 75°, with an atmospheric heat of 65°. They will soon form roots, and may be potted on as required, giving them a temperature of 65° to 75° with a rise of 10° by sun-heat. A little bottom-heat for the plants after the first shift will be beneficial.

**FRUIT BLOSSOM.**—Pyramid trees of Apples, Pears, and Plums, are, with very few exceptions, abundantly covered with fruit buds, and the two latter are about to burst into blossom. Any of the smaller trees, especially of the finer varieties, may with advantage be given some sort of protection. Pea-sticks, if well furnished with small twigs, will in themselves greatly assist in warding off spring frosts, and they will also in some degree break the force of cold easterly winds. If a piece of thin tiffany, or old muslin curtains, could be lightly drawn round the trees, on an evening when appearances denote a sharper frost than usual, the crop will be made more secure. Such makeshift protections may present an untidy appearance for a few weeks, but if by such means a full crop of choice fruit is secured, the compensation is not inconsiderable.

### PLANTS UNDER GLASS.

By J. SO. MCINTYRE, *Gardener, Woodside, Darlington.*

**THE PLANT STOVE.**—The majority of the plants having been put in proper order for the season of growth, the shading of the house, which ought in all cases to be capable of being rolled up, must be put in order, the tender growths of the plants rendering its use very necessary during bright sunshine, but only at such times.

**THE FERNERY.**—The Ferns will in nearly all cases have started into growth, and increased attention will be called for in affording water to them. The water for use in a fernery should be rain-water by preference, or, failing that, river or pond-water. If hard water must be used, the water-tanks should be filled some time previously to the water being used for watering or syringing, the exposure to the air tending to "soften" it somewhat. In watering ferneries where rock-work is largely used and the Ferns are planted out, and especially ferneries newly formed and planted, the plants before becoming established are sometimes afforded too much water, with the usual result of a spongy soil and stunted growth. In established ferneries, where usually the Ferns have large quantities of roots, heavy waterings are demanded when the plants are growing.

**ADIANTUM FARLEYENSE.**—The method I adopt with this variety is a simple one, yet it is very successful. It is grown in the form of half-specimens, and also in small thumb-pots, the latter being well adapted for dinner-table and other indoor decorations. To have these small plants in fine condition, the larger plants are divided into single crowns while in a quite young state, and potted firmly. Mistakes are sometimes made in potting *A. Farleyense* entirely in peaty soil; but the best compost, and one in which it thrives, is good strong fibry loam two parts, and one part peat, with river-sand in sufficient quantity to keep the soil porous. The drainage should be ample. Other conditions are a warm-house and plenty of moisture whilst the plants are growing, the avoidance of thick shading, as the more the plants are exposed to sunlight in reason the deeper the green colour of the fronds.

**HYACINTHS.**—If these bulbs are being grown for exhibition, a great difficulty is experienced in mild springs in retarding the flowering, as is the case this year. If a greenhouse with a northern aspect is at command, the plants may be placed therein, care being taken to exclude bees, which, if admitted, soon disfigure the flowers, particularly white varieties, and tiffany should be placed over the ventilators to exclude them.

**POT ROSES** may have applications of some kind of fertiliser, continuing its use during the flowering season; and just before removing the plants to the show-house, see that they are freed from aphides. The weaker Tea Roses will probably require some slight amount of support from light-green painted sticks, and this should have attention some time before the plants come into flower. H. P.'s, when sturdily grown, require no supports.

**DAPHNE ODORATA.**—The plants should now be repotted or top-dressed, as may be necessary, using fibry loam of good quality and sharp sand. Place them in gentle heat to start them into growth.

**BORONIAS.**—These plants, now in full bloom, are beautiful objects in the conservatory, and serviceable also in indoor decoration; *B. megastigma*, a very fragrant species, being a charming plant for placing in vases in apartments. All *Boronias* when in flower do best in a cool house. The plants, as soon as the flowering is over, should be cut back, so as to force them to make compact heads. In potting *Boronias*, which in the case of young stock should be performed before the flowering, fibry peat of the best quality and coarse silver-sand should be used, pulling it to pieces but not sifting it, and doing the potting by the aid of a rammer.

### THE KITCHEN GARDEN.

By C. HERRIN, *Gardener, Droymsire, Miltidenead.*

**TOMATOS**—Where strong plants are required for planting against fruit walls and on borders, seed should be sown during the coming week. It being a very desirable matter that the seedlings from the start to planting-out time should receive no check, or be stunted by want of pot-room, it is useless to sow very early. Such early plants run the risk of remaining some time in a pot-bound condition whilst waiting for suitable and safe weather for planting out, which rarely occurs, even in southern counties.

until late in the month of May. Seeds may be sown thickly in pots or shallow boxes, and barely covered with finely-sifted soil. The pots, &c., should be stood in a house or pit having a temperature of about 55°, not higher, it being desirable that the seedlings from the first shall be grown as sturdily as possible. As soon as germination of the seed has taken place, keep the pots close to the glass, and pot off singly into small 60's when the plants are large enough to be readily handled, and from these pots they should be transferred to 5 or 6-inch ones, which by planting-time will be filled with roots. Thorough success in Tomato culture depends very much upon the character of the weather—with such a summer as last year almost any variety will succeed; but for outdoor planting it is prudent to choose only such varieties to plant in quantity as ripen their fruits early, of which Sutton's Earliest of All is one of the first to ripen; Parly Ruby, an American variety, of good quality; Frogmore Selected, which fruited admirably last year, but was much less solid and fleshy than some others; and Turner's Prolific, which grown alongside the latter, was of excellent quality. Among yellow varieties, Golden Nugget and Sunbeam are two of the best.

**VEGETABLE MARROWS**—Provided some such protection as hand-lights or garden-frames are available for covering the plants raised early, seeds may be sown forthwith, and by preference singly, in 4-inch pots three parts filled with soil; otherwise nine or ten seeds may be sown in a 6-inch pot, the seedlings to be transferred singly to other pots as soon as they get large enough to handle. The seed-pots should be placed in gentle heat, and when the seedlings are large enough to be potted off, they should be grown on for a week or two in a temperature of about 50°, and well exposed to sunlight. If the seeds are sown singly in pots, no repotting is necessary, but they should be earthed-up when 4 inches high, leaving, of course, space for affording water. Before the plants are put out into hills or beds, some amount of hardening-off is necessary, which is best done in a garden-frame. It is always a safe proceeding to protect the newly-planted Marrows with hand-lights for a few weeks, in case of frost. A large flat bed of leaves or of garden-refuse, 2 feet or more in depth, erected in some out-of-the-way corner, affords a good means of growing Vegetable Marrows; and on this bed should be placed about two wheelbarrow-loads of loam for each pair of plants, making it moderately firm before planting. Pen-y-byd, and the Long White, are two excellent varieties for general use.

**VARIOUS**.—Special attention should be given to early-sown Peas, those raised under glass and planted out on a south border being forwarded a little by affording shelter to the rows in the event of cold weather, for which purpose a line of garden wats may be hung up by their sides to wooden stakes driven into the soil along the front and ends of the border. Where Spruce Fir branches form the protection, these should be thinned out, or removed altogether from the sides of the rows, to prevent weakening of the plants. If birds devour the tops of the Pea plants, slightly strew the latter with soot whilst damp, being, however, careful not to use soot from the boiler flues if coke is the fuel chiefly burned. Any Parsnips, Leeks, Salsafy, or Carrots that may have been left on the land where they grew should be lifted, and laid-in on a north border; or (excepting the Leeks) stored in damp soil or sand in a cold shed. A sowing of Couve Tronchuda, various Kales, and Savoys—providing the latter are required early—should now be made in drills 9 inches apart on a border which can be conveniently netted over to protect the seeds from the birds. If in demand, a pot or two of Chili Capsicums may be sown, placing the seed-pots in heat. Rain having fallen in many parts of the country, the preparation of the ground for seed-sowing is rather difficult, and now every chance must be seized, when the surface is workable, to stir it, especially when beaten down by heavy rains, and thus enable it to dry quickly when the sun shines.

**CARROTS AND BEET**—Assuming the sowing of the main crop of Carrots should be left for some time in April, it will be advisable to sow a few rows of some early kind, such as Sutton's Gem, or Early Nantes, on a sunny quarter as a succession to those sown in frames; and where these appliances are not available, Carrots may be forwarded if sown now on a hot-bed made up as previously advised, making use of boards and mats to improvise a sort of frame, and keeping it covered until the seed germinates. Should the stock of Beetroots be insufficient to meet the

demand till the main crop, to be sown later, becomes ready for use, a few rows of the quick-growing Egyptian Turnip-rooted variety should be sown forthwith in drills 1 inch deep and 15 inches apart. The long Beets are usually much preferred, and there is no difficulty in keeping them quite fresh and good until late in the summer, if pitted in a northerly aspect, shaded by overhanging trees.

**POTATOS**—Weather permitting, another break of Potatoes may be planted, choosing a very sheltered position, planting Ringleader, and Veitch's Ashleaf Kidneys; and if the sets have been standing on end in boxes, they will be furnished with sturdy shoots, and in good condition for planting. The sets should be set in drills drawn to a depth of 5 to 6 inches, and 2 feet apart; and a sprinkling of dry wood-ashes scattered over the ground and in the drills will aid in producing clean tubers, and render the soil easy to work.

### THE ORCHID HOUSES.

By W. H. WHITE, *Burford, Dorset.*

**CALANTHES**.—Orchids which flower in the winter are much admired, and perhaps none more so than the deciduous species of *Calanthe*. When the plant is well grown, the flower-spikes being large, are very appropriate and valuable for decorative purposes, and arrange well with plants of Ferns, Cyperus, Palms, and others, and when cut they last for several weeks in a cool place. Where a number of varieties can be grown, a succession of flowers may be kept up from the month of November till April. *C. vestita* and its varieties, *C. Sedeni*, *C. bella*, *C. Victoria Regina*, *C. Harrisii*, *C. rubro-oculata*, *C. luteo-oculata*, *C. Burfordiensis*, and the distinct hybrid *C. porphyrea*, are the first to open their flowers, and when these are getting past their best, the varieties of *C. Regnierii*, *C. Sanderiana*, *C. Stevensi*, *C. Turneri*, *C. T. nivalis*, commence to open. The varieties first mentioned have begun to grow, and should be potted when the new growths are a few inches in height, or just before new roots push out. The compost in which *Calanthes* should be potted ought to be more retentive of water than that used for most species of Orchids, and may consist of one-half fibry loam, from which the finer particles have been mostly shaken out, one-fourth dry cow-dung, and one-fourth finely chopped sphagnum-moss, small crocks, and coarse, clean, silver sand, the whole being well mixed together. The compost after preparation should lie a few days in a warm place before being used, otherwise a check may be given the plants. The whole of the old soil should be shaken from the pseudo-bulb, the dead roots shortened to about 1 inch, and every vestige of white or brown scale insects, which commonly infest them, cleared off. The flower-pots should be of various sizes to suit the plants or the accommodation at hand; where this is limited, place five good pseudo-bulbs in a sufficiently large pot, otherwise they may be potted singly, which has advantages in several ways. My practice is to pot the strongest singly in 5-inch pots, and the smaller ones in pots of a lesser size. The pots must be rather more than half-filled with clean drainage materials, over which a thin loamy turf, grassy side downwards, should be placed. When the pots are being filled up, the soil should be shaken down with a moderate degree of firmness to about an inch of the rim; then the pseudo-bulbs should be placed on the surface and made firm with more soil, so that the remnants of the roots and bottom of the new growths are covered, which will leave about half an inch of space for holding the top-dressing of loam, which the plant should have when established and it is about one-half through the season of growth, a time when young roots will usually appear on the surface. For the first few weeks after re-potting, the plants should not receive much root-moisture, which is a point in their culture the beginner should pay particular attention to, for if the compost becomes unduly moist the tips of the young breaks are liable to turn black and the health of the plants to be impaired. My practice is to place them in a light airy position in the East Indian-house, and afford no water at the roots, but merely to moisten the pots with water through a syringe till the growths show signs of progress, and then to occasionally slightly sprinkle the soil with a fine rose watering-can. When the plants get firmly rooted the growths will be in full vigour, and abundance of water may be afforded alternately with weak liquid-manure. The stock of any variety or species of *Calanthe* may be increased by taking off the old back bulbs at the re-potting, and inserting them thickly in flower-pots filled with sphagnum-

moss; and just before the appearance of new roots dividing and repotting them as advised for the older examples. No amateur need fail in growing and flowering *Calanthes*, even if he have no house devoted to Orchids, an ordinary stove answering all requirements.

**EULOPHIA GUINEENSIS**.—The plants of this rare species, the rich flowers of which appear in the summer and last a long time in perfection, may now be potted and treated in every particular like *Calanthes*, excepting that when growing they should have rather more shade.

**BLETIA HYACINTHINA** is a deciduous plant, requiring cool treatment, which is now showing signs of growth taking place, and ought no longer to be kept at rest. If repotting be necessary, the pseudo-bulbs may go into *Calanthe* compost, and the plants, when growing, be exposed to the light in the coolest available house, and afforded water copiously till flowering is past, when it must be gradually withheld and the plants stood in the full sunshine to mature. Other species of *Bletia*, when in growth, require also a light position in the intermediate-house.

### FRUITS UNDER GLASS.

By W. POPE, *Gardener, Highclere Castle, Newbury.*

**THE PINERY**.—The fruits which pushed up about the new year, and are now swelling apace, need have no increase in the night temperature, and 70°, or if very mild 5° higher, is a suitable warmth. If ripe fruits are required with as little delay as possible, rather push on the plants by day than by night, especially making the most of sunshine. Commence to give air to the fruiting-house, when a warmth of 80° is reached, and close it early at 85° or 90°, with plenty of aerial moisture. The bottom-heat may range between 85° to 90°, and more water will now be required at the roots, the soil being kept always moist, whilst avoiding excess in this matter. If the soil round the collar of the plant is sunken, afford a top-dressing of rich turfy loam. Weak guano-water may often be afforded when root-moisture is needed. Suckers should be reduced to one or two on a plant. On bright afternoons the plants and bed may be lightly syringed with tepid-water, being careful not to wet the crowns, as if these are moistened they will grow to a large size, which is an unsightly feature. Fruit now beginning to change to the colour of maturity, should be afforded a well-ventilated house, otherwise the flavour will be inferior; at the same time too much dryness at the root must be guarded against, as anything in the nature of forcing on ripeness at this season in this manner is at the expense of juiciness. Every attention should be paid to the young stock which was repotted early in the present month and in February, which will be in full growth, requiring more air than hitherto, and water sufficiently often afforded so as to keep them growing without check. These plants should be examined on alternate days, and the surface of the soil of recently-potted plants slightly turned over by the hand, when if it be found that though dry on the surface the soil below is moist, and a syringe of water afforded at closing time will suffice to moisten the surface, the plunging materials being moistened likewise—this method being much preferable to indiscriminate overhead syringing. It may be necessary to shade the house slightly during bursts of bright sunshine succeeding a period of rainy or overcast weather, otherwise the leaves will be severely browned and growth checked. The shading may be discontinued as soon as the plants become inured to the sun-line. If the bottom-heat should rise higher than 90°, move the pots from side to side, which will leave a slight space at the sides and prevent injury to the roots as well as let the great heat escape. This precaution is especially necessary where tanner's bark or other fermenting materials are used; a night temperature of 65° will suffice for these plants for the present, as keeping them sturdy and strong is better than long weak leaves.

**CUCUMBER**.—As young plants come into bearing the old plants and beds should be cleared away, the pits, glass, &c., thoroughly cleaned and got ready for successive crops of Melons or of Cucumbers. The temperature at night may be increased to 70°, and the soil kept steadily moist as well as the air. In the daytime the warmth should reach 85° to 90° with sunheat, but lower figures should rule in dull weather. Remove growths not needed for extension, doing this twice a week so as not to remove much foliage at any one time. Warm and weak liquid-manure should be afforded to plants in full bearing, and occasionally top-dressings of rich loam as the roots appear at the sides of the hills.

## EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

## APPOINTMENTS FOR THE ENSUING WEEK.

## MEETING.

THURSDAY, APRIL 2.—Linnean Society meet.

## SALES.

MONDAY, MARCH 30 { Roses, Greenhouse Plants, Begonias, Gladioli, &c., at Protheroe & Morris' Rooms.  
Hardy Perennials, Carnations, New Violets, Begonias, &c., at Protheroe & Morris' Rooms.

TUESDAY, MARCH 31 { Imported Orchids, from Messrs. W. L. Lewis & Co., at Protheroe & Morris' Rooms.

WEDNESDAY, APRIL 1 { Japanese Lilies, Palms, Begonias, Tuberoses, Palm Seeds, &c., at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT OLSHWICK.—45°5'.

Spraying. THE practice of spraying for the prevention and cure of the evils consequent upon parasitic fungi

and injurious insects, has taken a much larger development in the United States than with us. Whether our transatlantic friends suffer more than we do from these attacks, or whether our reticence is due to our inherent slowness to adopt new measures, is a point we need not stop to discuss. The fact remains, that "spraying" is very largely adopted by them; and relatively, very little by us. This delay on our parts may be advantageous if it ensure a less empirical system than that now in use. Until the life-history and attendant circumstances of the several pests are thoroughly known, much waste of energy and material is likely to occur. Again, it may be pointed out that in one instance, at least, the teachings of science have been misleading. In the case of the Potato disease, for instance, it was argued that as the fungus passed great part of its life within the tissues of the plant, and beyond the reach of any external applications, that therefore such applications were not likely to be of any service. The value of timely applications of the Bordeaux Mixture has, however, been amply proved. A large amount of prevention and mitigation, if not actual cure, is secured by its means, and these are no light matters.

It seems as if in the future we shall gradually adopt more and more of the procedures which our American friends find so useful. We therefore desire to call attention to a valuable little book, *On the Spraying of Plants*, by Mr. E. G. LODEMAN, Instructor in Horticulture in the Cornell University, with a Preface by Mr. GALLOWAY, chief of the division of Vegetable Pathology, of the United States Agricultural Department. This little book, which may be had of MACMILLAN & Co., deals with the history of the matter, its progress in various

countries, and gives details concerning the various pests affecting agricultural and horticultural crops, and the best modes of dealing with them. Ample details are also given as to the machines to be used, the constitution and preparation of the several substances used; in fact, the book is a veritable encyclopedia on the subject on which it treats. We append an extract relating to our practices here, merely adding that the author hardly does us justice in the matter of the application of sulphur for Vine-mildew—a practice that originated here; and he entirely overlooks the systematic practice of Hop-washing which has long been in use in the Kentish Hop gardens. We may incidentally note that one of the latest discoveries of the late Professor RILEY was that relating to the migration of the aphid from the Damson to the Hop—an indication that the two plants should not be grown near together.

"The English have been slow to adopt new remedies for plant diseases. While French growers were struggling to overcome the downy mildew of the Grape, and the rot of Potatoes, British gardeners were practically helpless in dealing with them. Even after success had rewarded their southern neighbours, the new methods were but slowly adopted in England. The horticultural journals of that country, on the contrary, were quick to see the value of the work that was being done, and the French recommendations were repeatedly published. The first account appears to have been given in the *Gardeners' Chronicle* (November 7, 1885, p. 594). This was a translation of a report made by PRILLIEUX, Inspector-General of Agricultural Education, to the Minister of Agriculture of France, regarding the value of a mixture of copper sulphate and lime against the mildew of the Vine. The account contains a brief history of the work done in the Médoc, and also mentions the names of the men who were most prominently connected with it.

The sulphide of potassium was at one time very highly recommended in England. It was first successfully applied by EDMUND TONKS (*Gardeners' Chronicle*, Feb. 28, 1885, p. 276). He used one-half ounce in a pint of water, and it proved to be very effective in controlling the mildew of Roses. This soon became one of the best known remedies in England, and may have been influential in delaying the adoption of French practices.

A note published in 1887 (*Gardeners' Chronicle*, August 6, p. 166) says that 'the sulphate of copper is being used largely in America and France against mildew on Vines. It is even suggested as a remedy for Potato mildew, but as this grows in the interior of the plant, it is difficult to see that it can effect much good. Amongst several methods of applying the copper solution, the simplest is to dissolve one pound of the pure sulphate in twenty-five gallons of water. Spray the Vines with a force-pump with a nozzle of fine aperture. An addition of one pint ammonia to the above solution adds to the effect. By ammonia, we presume a solution of the carbonate is intended.'

The progress made in France was carefully watched by some of the English journals. The results of the more important experiments were published, and English gardeners were not wanting in information regarding the value of the copper compounds. A few of the more important articles may here be mentioned. The *Gardeners' Chronicle* was especially active in this respect, and in 1883 (September 1, p. 244) it gave an account of the method of making the Bordeaux Mixture as recommended by PRILLIEUX. Three weeks later (September 22, p. 332) it speaks of the experiments of PRILLIEUX regarding the treatment of Potatoes for the blight. These experiments were very successful, and if the methods had been adopted in England, great losses would have been prevented. During January of the following year there appeared (*Gardeners' Chronicle*, January 12, 1889, p. 20) a translation of an article in the *Revue Horticole* regarding the proper manufacture

and use of the sulphate of copper and lime mixture. Several such translations were made during 1890, but these were apparently not heeded till 1891 (*Gardeners' Chronicle*, Aug. 1, p. 137), when the Royal Agricultural Society of England conducted some experiments for the prevention of blight upon Potatoes. These experiments were probably the first of any importance which were undertaken in England, yet they were not begun until four years after the value of the copper compounds had been known there. Messrs. SUTTON & SONS undertook a similar work. These first trials were not so successful as had been hoped, and undoubtedly prevented, to a certain extent, the more general adoption of the remedies.

The French authorities were almost exclusively quoted until 1891. By this time the work in America had assumed such proportions that much information of a very varied character was continually appearing. This was freely abstracted by the English journals, and during 1890 and 1891, doubts regarding the value of the copper compounds as fungicides were partly removed from the minds of English gardeners. But faith came slowly. The Highland and Agricultural Society made experiments which were discouraging in their results (see the *Garden*, 1892, Feb. 6, p. 133, based upon an article appearing in the *Morning Post*), and as a rule the first trials were not followed by such marked benefits as were reported from Continental Europe. As the methods of making the application improved, however, the growers became encouraged, and during the last two or three years Potatoes have been very generally treated with copper compounds for the blight by the more progressive growers. The successful issue of experiments made in the United States has, no doubt, materially assisted in bringing about this result.

The new insecticides have been adopted by English gardeners even more slowly than were the fungicides. Although the value of kerosene for the destruction of insect life has long been known there (*Gardeners' Chronicle*, July 15, 1882, p. 85, also known as paraffin in England), its use is still very limited. This, in all probability, is due to the fact that the remedies already at hand are so effective that little demand is felt for others—a condition of affairs upon which English gardeners are to be congratulated.

The arsenites, also, are very rarely applied, not only in England but throughout Europe. Their use is not so imperatively demanded as in America, and as there is a certain amount of danger in having them upon the premises, they have not been looked upon with favour. The use of arsenic for the destruction of insects is by no means a novelty in England. Mr. GORDON, the superintendent of the ornamental department of the London Horticultural Society, says that 'small brown ants are also very troublesome (to Orchid growers), but they may be destroyed by placing sugar and arsenic, ground to an impalpable powder, on bits of card near the places they frequent' (GEORGE GORDON in a paper, 'Notes on the Proper Treatment of Epiphytall Orchids,' *Jour. of the London Hort. Soc.*, iv., Nov. 19, 1848). A fear of poisoned fruit following the use of arsenic has also been expressed, and this, although perfectly groundless, has worked against the introduction of such remedies. But nevertheless, spraying has now become the rule and not the exception in some parts of England (*Jour. of the Royal Hort. Soc.*, 1895, Jan., p. 185). This applies particularly to 'the various fruit farms around Evesham and Pershore,' and may also be true of other localities. The benefits derived from the practice are being appreciated, and eventually all growers must see the necessity of its adoption."

LINNEAN SOCIETY.—On the occasion of the meeting which will be held on Thursday, April 2, 1896, at 8 P.M., papers will be read: I. "Monograph of the genus *Stemona*, Low," by C. H. WRIGHT; II. "On African Alga," by W. and G. S. WEST.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The Wolverhampton and Staffordshire Auxiliary branch of the above institution have arranged to hold a meeting at Lichfield on March 31; and the Mayor

has kindly lent the Council Chamber for the occasion, and will himself preside at the meeting. Interesting addresses will be given by the chairman, secretary, and members of the committee upon the advantages and benefits of the institution to gardeners, seedsmen, nurserymen, and their foremen, also market gardeners. The auxiliary will hold a spring show in the Drill Hall, Wolverhampton, on Thursday in Easter week, when a meeting of the stewards will be held, at which, it is hoped, that the Earl of DARTMOUTH will preside, and the Countess of DARTMOUTH open the spring show. Other meetings are being held at Stafford and other

have been called up and received. The offices of the Corporation, situated at 1 and 2, King Street, Covent Garden, are in every way particularly suitable for the purpose. The Directors deem themselves fortunate in having secured the services of Mr. A. J. MONRO as general manager and secretary, a gentleman who has had many years' experience in this class of insurance business. The Directors are pleased to be able to announce that most of the leading nurserymen and market growers have become both shareholders and insurers. Though the Corporation has been at work eleven months only, sufficient business has been transacted to have fully justified its formation.

Forty-seven agents have been appointed, viz., forty-one in the United Kingdom, five in the Channel Islands, and one in the Seilly Isles. The agents are paid by commission only. The Directors would be glad to receive applications from gen-

erally, and will himself preside at the meeting. Interesting addresses will be given by the chairman, secretary, and members of the committee upon the advantages and benefits of the institution to gardeners, seedsmen, nurserymen, and their foremen, also market gardeners. The auxiliary will hold a spring show in the Drill Hall, Wolverhampton, on Thursday in Easter week, when a meeting of the stewards will be held, at which, it is hoped, that the Earl of DARTMOUTH will preside, and the Countess of DARTMOUTH open the spring show. Other meetings are being held at Stafford and other

also had glass broken by the same storm to the value of £32 4s. His policy had only been granted three months previously. Both establishments were visited by the Manager the same day that the storm occurred—the claims were at once assessed, and the respective amounts paid within one week. The result of this storm, together with the prompt and satisfactory arrangement of both claims, brought a considerable accession of business to the Corporation.

DIRECTORS.—All the directors have qualified by taking the requisite number of shares, some holding a number considerably in excess of what is necessary to qualify them for a seat at the Board. The Board of Directors meet not less than once in every three months, whilst a committee of six of the Board meet as often as may be necessary to carry on the business of the Corporation. There were five Board meetings

FIG. 54.—FREESIA LEICHTLINI MAJOR. (SEE P. 392.)

FIG. 55.—FREESIA ODORATA LILACINA. (SEE P. 392.)

towns, and several concerts in aid of the institution will be given. *G. A. Bishop, Chairman.*

**THE NURSERYMEN, MARKET GARDENERS', AND GENERAL HAILSTORM INSURANCE CORPORATION, LIMITED**—On Friday, March 20, the first general meeting of the shareholders took place at Simpsons', 101, Strand, W.C., when the following report on the business of the Corporation for the year ending February 24, 1896, together with the audited accounts, was submitted by the Directors:—

The Corporation was registered on February 23, 1895, as a limited liability company, with an authorized capital of £100,000. The first issue was 5000 shares of £5 each, 3830 of which have been applied for and allotted, and 10s. per share

men who would undertake agencies in those districts not yet represented. The Directors desire to draw attention to the special advantage of insuring with this Corporation, viz., that those insured can replace immediately their own glass broken by hail, the Corporation paying them at the rate per square foot at which the glass is insured. Another special advantage, and one of which several insurers are availing themselves, is that of being able to cover the value of the contents of their glasshouses by increased insurance of their glass—an advantage offered by no other insurance company. The Directors sincerely hope that all insurers will also become shareholders, that the profits of the Company may be, as far as possible, for the mutual benefit of all interested.

**CLAIMS.**—A severe hailstorm occurred at Harpenden, Herts., on August 22, 1895, a district hitherto peculiarly free from such. One nurseryman (Mr. S. PHILLIPS) who had taken out an insurance policy only two months previously, had 11,500 square feet of glass broken, whilst his crops were out to pieces. His claim amounted to £191 13s. 4d., he having paid a pre-

mium of £21 18s. 8d. only. Another insurer (Mr. J. PURROTT) also had glass broken by the same storm to the value of £32 4s. His policy had only been granted three months previously. Both establishments were visited by the Manager the same day that the storm occurred—the claims were at once assessed, and the respective amounts paid within one week. The result of this storm, together with the prompt and satisfactory arrangement of both claims, brought a considerable accession of business to the Corporation.

**REVENUE ACCOUNT.**—*Incomes.*—The income from premiums amounted to £681 1s. 9d., which, with dividends derived from invested capital, £20 16s., made the total income £701 17s. 9d.

*Expenditure.*—The total sum charged against revenue was £352 4s. 9d., made up of the following items:—

Claims paid for 21 oz. glass broken by hailstorm	£283 17 4
Commissions on insurances	72 15 5
Working expenses, including Secretary's salary	214 0 0
20 per cent. written off formation expenses	79 4 4
10 .. written off office furniture and fixtures	4 7 8

**BALANCE SHEET.—Capital and Liabilities.—Shareholders capital:—**

3830 shares of £5 each	...	...	...	£19,150	0	0
Called and paid up 10s. per share	...	...	...	1,915	0	0
Sundry creditors	...	...	...	5	5	0
Balance of revenue account	...	...	...	49	13	0

**Assets.**—Of the paid-up capital, after deducting balance of formation expenses and furniture, £2018 8s. 8d. is invested in  $\frac{3}{4}$  per cent. Consols, amounting at cost price to £2075 15s. 8d. The remainder is included in the cash at bankers. The balance of revenue account is in cash at the bank and in hand. In accordance with the advice of the auditors, the Directors do not recommend the payment this year of any dividend to shareholders, and they suggest that the balance of all moneys in hand be held in reserve to meet any claims on unexpired policies which may possibly arise during the present year. The Directors are fully satisfied with the result of the first year's business, and they believe that the Corporation has before it a prosperous and very useful career. Messrs. Harry J. Veitch, James Sweet, Thomas Rochford, Joseph Rochford, Peter E. Kay, and George Moore retire from the Board, in accordance with the Articles of Association, and being eligible, they offer themselves for re-election. The auditors, Messrs. Baker and Howard, members of the Institute of Chartered Accountants, retire, and being eligible, offer themselves for re-election.

By order of the Board, HARRY J. VEITCH, Chairman.

**THE BARRON TESTIMONIAL.**—A meeting of the members of the committee appointed to carry through this matter was held at the Hotel Windsor on Tuesday afternoon, 24th inst., under the chairmanship of Mr. HARRY VEITCH. The minutes of the last meeting having been read and adopted, the chairman put the following recommendations of the sub-committee to the meeting, that the testimonial should take the form of a cheque to be presented to Mr. BARRON, on Tuesday, April 21 next, at the Hotel Windsor, and that Dr. M. T. MASTERS be invited to make the presentation, which were adopted unanimously. The feeling of the meeting was that an informal lunch should be partaken at the Hotel on the occasion of the presentation.

**"ROBARIAN RECORDS BY AN EX-EXHIBITOR."**

—Under this title the Rev. ALAN CHEALES has published the substance of a lecture delivered before the members of the Reading Literary and Scientific Society. It is a gossip little treatise *de omnibus rebus [rosariis] et quibusdam aliis [exque rosaceis]*. Mr. CHEALES divides his subjects into three heads—the Rose of Poetry, the Rose of Progress, and the Rose of Practice, under which last section the author discusses the feeding of the Rose, the raising from seed, "briaring," or the collection of Briar stocks from the hedgerows; budding, Rose-showing, Roses in towns, rules of judging, and other matters connected with exhibiting. The lecture may be read in half an hour, and a very pleasant half-hour too. The publisher is Miss LANGLEY, London Street, Reading.

**NEWCASTLE-ON-TYNE FLOWER SHOW.**—It will be seen from our advertising columns that the Newcastle Spring Show will be held on Wednesday and Thursday, April 15 and 16, in the Town Hall and Corn Exchange. This is one of the finest spring shows in England. Shows will also be held under the same auspices on July 8, 9 and 10 (summer), and November 18 and 19 (Chrysanthemum).

**CHESTER HORTICULTURAL SHOW.**—The committee have decided to award the Silver Cup offered by a member of the Council of the Royal Horticultural Society, value 10 gs., to the winner of Class 1 (Group of Plants), in addition to the 1st prize of £25. At next year's show prizes will be offered for fruits and vegetables gathered in 1896, and preserved either by bottling (in glass bottles or jars) or by some process of drying (evaporation or otherwise).

**THE SURVEYORS' INSTITUTION.**—The next ordinary general meeting will be held on Monday, April 13, 1896, when the adjourned discussion on the paper read by Mr. A. A. HUDSON (Associate), at the meeting of February 17, entitled "The Conditions of Building Contracts," will be resumed. The chair to be taken at 8 o'clock. Notice is given that the Institution premises will be closed from Thursday evening the 2nd to Wednesday morning, the 5th of April.

**FLOWERS IN SEASON.**—Flowers of the fine Violet variety California, sent out by Messrs. PITCHER & MANDA, nurserymen in this country, but now settled at Short Hills, New Jersey, have reached us from Mr. Wadds, gardener at Birdsall, Yorkshire. The flowers of this variety are dark violet in two shades, large, and with a stout stalk 7 to 8 inches in length, the value of which will be obvious to florists and bouquetists. From Messrs. P. BARR & SON, King Street, Covent Garden, have been received a few flowers from his treasury of such things at Long Ditton, which serve admirably to mark the advance of vegetation in the open. These consist of *Chiono-doxa sardensis*, *C. gigantea*, a large flowered light-blue variety; and the well-known *C. Lucillia*. *Scilla tanica alba*, useful in small floral arrangements in the open air for its colour and dwarf stature; several varieties of *Narcissus*, including *N. corbularia citrina*, *N. cyclamineus*, and *N. Golden Spur*; the dark port wine-coloured *Fritillaria latifolia*, *Erica carnea*, and *Iris reticulata*.

**THE BOTANICAL SCHOOL OF TRINITY COLLEGE, DUBLIN.**—In the form of "Notes," Prof. PERCEVAL WRIGHT gives an interesting account of the genesis and gradual evolution of the herbarium in the notable school of learning in which he occupies the post of Professor of Botany.

In the course of the note we come across the statement that Dr. PATRICK BROWNE was at one time curator of the Oxford Botanic Garden. It may have been so, but we should like to see satisfactory testimony to the fact. In 1834, Dr. THOMAS COULTER, who had travelled in Central Mexico and California, was appointed Professor of Botany and curator of the herbarium. After him is named a Cypress, but it is not an easy matter to say which is the right species. Seeds taken from his herbarium grew many years after collection, and from them were raised trees in the Glasnevin Botanic Garden, one or more of which bear COULTER'S name, but so far as we know, they have not produced cones. COULTER laid the foundation of the herbarium. HARVEY, gentle yet energetic, amiable but firm, built the superstructure. By his subsequent travels in Australia, the herbarium was much enriched, and on his return HARVEY set to work with little or no assistance to examine and arrange the accumulations that had accrued. For more than a month, he writes, his days were spent in laying down the specimens of Composites to be glued. It is impossible not to lament that such mechanical labour was not entrusted to other hands than Dr. HARVEY'S. In the end, HARVEY died of consumption at Torquay. Dr. ALEXANDER DICKSON occupied the botanical chair for two years, to be followed in 1869 by the present professor. Things went on smoothly till in May, 1882, the edict went forth that the herbarium was to be removed to other quarters. By perverse mischance, the removal was effected by the workmen without supervision, and when Prof. WRIGHT appeared upon the scene, he found that the cases had been emptied, and the packets of plants placed pell-mell on the floor and in the corridors. The admixture of bundles was thorough. Years were required to repair the consequences of this misadventure, but it is satisfactory to know that the herbarium is now in good working order. The other papers in these "Notes" refer to stages in the division of the nucleus by Mr. DIXON, assistant to the professor of botany, and show that the provisions for research in the University are not limited to the herbarium and garden.

**CORNISH BROCCOLI.**—The *Western Morning News* of March 20, 1896, states that Tuesday, the 17th inst., was a record day in the West Cornish Broccoli traffic. There were then despatched 199 trucks of Broccoli from Penzance, Marazion, and St. Erth, in eight special trains. In many instances the Broccoli were loaded into the trucks loose instead of in crates.

**THE CROYDON CHRYSANTHEMUM SOCIETY** shows, by the ninth annual schedule, a considerable amount of vigour. In addition to the usual cash prizes and special prizes, there will be offered for

competition at the forthcoming exhibition on November 10 and 11, a Champion Challenge Cup of the value of 25 guineas. It is offered in the class for thirty-six cut blooms of Japanese, and will become the absolute property of any exhibitor who succeeds in winning it upon three occasions in five years. The Secretary is Mr. W. B. BECKETT, 272, Portland Road, South Norwood, S.E.

**THE SEVENOAKS HORTICULTURAL SOCIETY** will hold its next annual exhibition in Knole Park on Wednesday, August 12, 1896. This show has become a very popular one in Kent, and it meets with a good deal of local support.

**EALING GARDENERS' ASSOCIATION.**—A successful smoking concert was given in the Lyric Hall, Ealing, on the 18th inst., in aid of the Gardeners Orphan Fund. This is a popular form of entertainment that might be profitably taken up for the same purpose by other gardeners' associations.

**APPLE GOODWOOD PIPPIN.**

A VARIETY of Apple which has recently been brought to notice is the one represented by fig. 56, p. 399. Fruits were exhibited recently before the Royal Horticultural Society, by Mr. R. PARKER, gr. to the Duke of Richmond and Gordon, at Goodwood, Sussex. The variety has been known at that place under the name of Lincolnshire Reinette, but it is now thought to be an unknown kind, and the name cannot be traced in any published list so far as has been ascertained. The Fruit Committee unanimously agreed to recommend the variety an Award of Merit, and the name has since been altered to Goodwood Pippin. The fruit in many points resembles Blenheim Orange, but is distinct from that variety. It is generally rather larger than the specimen figured, round, moderately conical in shape, yellow, very slightly streaked with red on the shaded side, and possessing numerous minute russet spots, but the exposed side is very well and evenly coloured. The stalk is set in a narrow, rather deep, russet cavity; the eye is very shallow, and partially closed. It is evidently a very good keeper, and may be used for dessert or culinary purposes. The flavour, being certainly not better than Blenheim Orange, it is a fruit likely to be more popular as a kitchen fruit.

**HOME CORRESPONDENCE.**

**THE LARCH DISEASE.**—Mr. A. C. FORBES said in his first letter that there were about a dozen timber tree diseases as bad and prevalent as the Larch disease, whereas there is not one to compare to it, in this country at least, and when Mr. A. C. F. made the statement I really thought he did not know the disease well; for no forester who knew the extent to which the disease prevails, would have written what your correspondent wrote. He will now probably modify his opinions after reading his friend "A. D. W.'s" note. His explanations of his theories concerning the disease, in his last letter, show clearly enough that he is only surmising on the subject. It appears now, however, that we agree as to what the "Larch disease" is, only your correspondent's description of it is the "book" description, and not that of the man, who knows it familiarly by sight. The Larch disease as Mr. A. C. F. "knows it," is not "exactly similar" to the Ash disease, and it causes more than "what is usually known as a blister." On old trees the disease causes huge lumps nearly the size of the crown of a round-hat or bigger—big bulging lumps or running sores, which lumps, even on young trees extend to the small branches in numerous lumps—looking like knots in winter, when they can easily be seen. This is the disease said to be caused by the *Peziza*, and familiar to me long before I knew of the *Peziza*, with which, I fear, your correspondent is better acquainted than he is with the disease itself. Nor is the tree killed so soon as he seems to imagine. Its growth is arrested, and as a timber tree it becomes useless; but the diseased spot is not so much dead as diseased. Your correspondent's reasons for the disease that it has been planted in all sorts of situations is quite fallacious, for the same may be said, and more, of the

Scots Fir, the Spruce, and almost any timber tree, none of which are subject to a disease like the Larch disease. *J. S. W.*

**FORMING A HERBACEOUS BORDER.**—Under the above heading I regret to see such an excellent gardener as "H. W. W." (see p. 360) recommending the planting of bulbs with herbaceous plants, the bulbous plants being best planted in a border by themselves. The reasons for this are obvious, viz., bulbs do best when left undisturbed for a number of years, whilst herbaceous plants should be mainly replanted once in two or three years; moreover, when bulbs are in a dormant state, the workmen's feet or spade come in dangerous contact with them. Of course the bulb border, if unsightly when dormant, can be furnished or carpeted with a series of dwarf, shallow-rooted, hardy flowers—or a judicious selection of annuals or biennials may be accommodated; but I personally object to the tall-growing plants named in the list being planted with bulbs. Besides, "H. W. W.'s" list is not up to date, otherwise why leave out such gems as *Heuchera sanguinea*, the *Monardas*, the *Campanulas*, *Paeonies*, *Senecio*, *Statice*, *Scabious*,

**MANDEVILLA SUAVEOLENS OUT-OF-DOOR.**—Last August a fine plant of this greenhouse climber was in full bloom at Murley Grange in this village. It grows on a south wall between two large bay-windows, and must be an old plant, as there are three stems, each more than an inch thick near the ground, where one of these stems has aerial roots. The roof at about 20 feet from the ground, projects 2 feet from the face of the wall. The lower 13 feet of the wall is covered with a thick bush of Myrtle, behind which the *Mandevilla* grows. The upper 7 feet has long horizontal branches of a *Wistaria*, amongst which the plant I am describing climbs, its branches extending to fully 50 feet in length. It was a lovely sight when in bloom, particularly the middle part of it, from being associated with the violet flowers of *Buddleia Lindleyana*. Early this month the gardener noticed two long fruits of it amongst the top shoots of the Myrtle. They came from the terminal flowers of a cluster. The pods are 17 inches long, and are exactly 1 inch in circumference, dehiscent down one side, and containing little brown ripe seeds, some of which have just been sown. *W. Thomson, Bishops-tington, South Devon, March 23.*

that are left of the Black Larch are on dry soil, where they have grown very badly, and are very stunted, and spreading in their growth; but there are three or four trees of the Black Larch, which I raised from seed some forty years ago, and planted in wet sandy soil near a pond, which have grown into fine trees. I have never tried their timber. They are very different looking from the Red and common Larch; these last are not very easy to distinguish one from the other. *C. W. Strickland.*

**STEAM LAWN MOWERS.**—I have been much interested in late in the correspondence which has been passing between "Hortus" and Mr. T. H. Mawson, on the above subject, and I must confess that I was somewhat amused at the tone of the latter gentleman's letter. For my own part, I had come to regard it as a matter only of past history for a man to condemn the use of steam as a motive power. There was a time when landed gentry and country squires resisted, with every available effort, the introduction of railways on which locomotive steam-engines were to be used, and it is perhaps not very difficult to understand their reason for so doing; but why a man should exert himself to prevent the lightening of human labour is beyond my powers of comprehension. I cannot bring myself to see that the introduction of steam as the motive power for lawn-mowers in any way lowers the position of a gardener as a craftsman, because very little craft is required to steer a machine, whether it be moved by manual, animal, or steam-power. The advantages of steam-mowers, judging from the description given of them by Mr. Don on p. 271, must be obvious to every one, and besides the consideration of economy, which is a very important one, there are other reasons which justify the adoption of steam lawn-mowers. I have had a little experience with machines worked both by men and horses, and I venture to say with regard to the former, that Mr. Mawson or any other man who has to work a lawn-mower on a hot summer's day, would feel inclined to endorse the sentiment expressed by the Irishman who was undergoing his punishment on the treadmill, when he turned to the warder and said, "Sure, master, an' it would go a good deal easier wid steam." The claim of steam to priority to the horse-machine is none the less. Any one who has had any experience in the management of lawns will be well acquainted with their unsightly appearance after a spell of wet weather, when they have been mown with a machine drawn by a horse or pony. The depressions of the animal's hoofs left all over the lawn, verges trodden down and made irregular, and often injury to flower-beds, are anything but pleasing, to say nothing of the many little escapades which almost inevitably accompany the employment of animal power. Taking an unbiased view of the different motive powers, I have no hesitation in saying that where there are large lawns to be kept in order, the use of steam as the motive power is most advantageous, and I do not think we shall be doing any "irreparable injury to one of the purest enjoyments of this country," or that the prestige of gardeners will in any way be lowered by its adoption; and the sooner Mr. Mawson can rid himself of his conservative notions and his little prejudices, the sooner will he be able to still further increase his prestige by being able to devote more time to other and more important details in the gardeners' profession than that of handling a lawn-mower. *P. Wilkinson.*

**PRUNING ROSES.**—Roses are starting into growth much earlier this year owing to the remarkably mild winter. I venture to make a few remarks in season on dwarf H.P.'s. For pruning, a pair of *secateurs* and a knife are necessary, but use the knife as much as possible, only using the *secateurs* for dead wood, always taking care to make a clean cut with the knife afterwards; if this is not done, the result is that the water gets down into the stem and causes it to rot. But pruning is best done according to the judgment and skill of the operator, and too much pains cannot be taken with it, especially on young Roses which are newly planted. These should be cut back to three or four buds, with an eye to forming a foundation of strong growth; and established plants should be examined to ascertain if they are on their own roots or not. A good method of pruning is to cut away all wood which is two years old, leaving only last year's growth; in the case of a plant with from five to six well-ripened shoots cutting back two or three of those in the centre to about three buds, and lightly pruning the other shoots, that is, leaving about six buds on each, according to strength. In this way many desirable objects are achieved, viz., vigorous strong growth as the result of severely

FIG. 56.—APPLE GOODWOOD PIPPIN. (SEE P. 398.)

*Erigeron*, *Dictamnus*, *Pulmonaria*, *Achillea grandiflora*, the Pearl Carnation, *Aquilegia glandulosa* and *corulea*, *Eriogonum*, and a host of others which this friendly criticism is calculated to supply? [Our correspondent did not profess to give a complete list, nor was it desirable. Ed.] *W. Crump, Madresfield Court.*

**PROTECTING FRUIT FROM BIRDS.**—In your last issue you have an article under the above heading, signed T. Coomber, to which I can say "Amen." Seven years ago I made a cage 110 feet long, and 45 feet broad, and 9 feet high in centre, of 3-inch galvanised netting, supported by old gas and water-pipes obtained from a builder. There are walls on each of the two sides, but the ends are entirely of wire, and I have no framework of strong iron. It cost complete £20, and has not been repaired. It has a door at each end, like your correspondent's. The result has been wonderful. For instance, a Coe's Golden Drop Plum on the wall is bisected by the wire. The half outside had last year three or four Plums left to ripen, while inside some two dozen or more. The only frame-work necessary is some good stout wire here and there to brace it together. Birds are very numerous here, for while there are innumerable gardens without fruits whose owners feed the birds all the winter through, those containing fruit are few. *A. Hutchinson, Major-General, Bournemouth.*

**PETERSHAM MEADOWS.**—Referring to the paragraph on this subject at p. 365 of your paper of the 21st inst., I shall be glad if you will kindly notify that the Bill which was rejected would not have injured the view from Richmond Terrace, but, on the contrary, would have preserved it for ever. Unfortunately, Mr. John Burns paid a hurried visit to Richmond just before the Bill came on; and not being acquainted with the locality, or the position of the lands proposed to be enclosed, imagined that they were in sight of the terrace (which they are not), and told the House of Commons so; the mistake was a very unfortunate one. There is a letter in the *Times* of March 24 from General Webber, one of the Dysart Trustees, explaining the whole matter. *Charles Burt, Chairman of the Amenities Committee of Richmond Corporation.*

**AMERICAN LARCHES.**—I have told you nearly all that I know about the American Larches. There are old trees at Boynton of both the Red and Black American Larches, planted upon two or three different soils. In a wood, the soil of which is a loose rather wet sand, the Red Larch has grown as freely as the common Larch, and to nearly as large a size; but we do not consider the wood of the Red Larch quite equal to that of the common Larch—it is more liable to twist and warp. It is probably as durable. On drier soils the Red Larch is much less healthy and vigorous than the common Larch. The few old trees

cutting back the middle shoots instead of a lot of weak ones smothering up the middle of the plant, whilst those which were not cut so far back will furnish enough strong shoots to rely on for bloom, and they will not be so tall as the centre ones. It will be understood that weak-growing varieties should be more closely pruned, but allowance must be made in all cases for the strength and vigour of each particular plant, and the space it is required to fill; and in case of plants on which the buds have not broken into leaf below the point of severance, it is best to rub them off, so as to throw the sap into the lower buds. Whenever possible, the same man should prune the Roses who performed the work the previous year. After pruning the Roses, strew the beds with guano or Beeson's manure, and fork them over lightly and carefully, so as not to disturb the roots near the surface. Pruning is deemed by some persons to be a simple operation, and inexperienced men entrusted to do it, which is a mistake; for much pains should be taken with it if the plants are to be kept in a vigorous condition. Except in early parts of these islands, the present month is early enough to prune Roses. *T. Appleby, Sheffield.*

**DIPLOSIIS PYRIVORA, OR CECIGOMYIA NIGRA.**—Some time ago I asked through the columns of the *Gardeners' Chronicle* for information from anyone who had been troubled with this highly-destructive insect, and the best means of dealing with it. For some reason this information was not forthcoming. Since then I have had correspondence with the Board of Agriculture, Miss Ormerod, and others, but still I cannot get any further than the advice to gather and burn the infested Pears, and to top-dress the surface of the ground with lime, soot, &c. All this I have steadfastly done, but still the insects come annually as numerous as ever. This season I am spraying the trees daily with a liquid compound, made by boiling 7 lb. of soft-soap, 10 lb. of Quassia chips, and a little Paris Green, in 100 gallons of water, the whole being strained through a canvas bag before use, and hope to settle them, or make their quarters distasteful. We are surrounded by large Pear orchards, where insects breed undisturbed in myriads, and which are probably the source of infection. Fruit growers seem hitherto to have been deficient in knowledge about this insidious little midge, but it is to be hoped that in time methods of destruction will be discovered, for it is my opinion that the *Diplosis* is the worst of all insects that infest Pear trees. I enclose extract from Schmidberger, "The number of eggs these midges lay vary from one to thirty (I have counted over sixty myself in one tiny fruit), which hatch in a very short time, if warm in four days, from time of deposition. Before the blossom is expanded they descend to the core, here they continue till the inside is exhausted; they generally leave at a rainy time, coming out on to the exterior by cracks or borings, whence they spring to the ground. Ofttimes they remain in the Pear until the fruit falls. The period of the full development of the insect commences as early as January 9, and continues consecutively until April 18, or later. A midge has been seen with its long ovipositor inserted on the side of the blossom before it opened, but generally it lays its eggs on the middle of a single blossom by piercing the petals. The general colour is dark grey or black, average length 2.5 millimetres, ovipositor when extended longer than rest of body; pupa, average length, 3 mm.; head, thorax, legs, and wing cases, blackish; abdomen, yellow; larvæ, length, 4 mill., colour, pale yellow; surfaces polished and very faintly reticulated." It is to be hoped the above description will be sufficient for the identification, and assist to direct attention to the midge, and experiments to be made how best to combat its attacks. For my part, I shall keep a correct record of the spraying, and with the Editor's permission, record results later on, hoping others will do likewise. [Please do so. Ed.] *W. Crump, Madresfield Court.*

## NURSERY NOTES.

MESSRS. B. S. WILLIAMS & SON.

At the Upper Holloway establishment recently there has been a considerable display of flowering bulbs. Hyacinths have been particularly well represented, and at most of the spring shows Messrs. Williams have exhibited them in quantity. There are but few new varieties of Hyacinths to claim one's attention now-a-days, though we have had occasion to notice this season one named *Lady Clinton*, which bears single

flowers of a pretty blush tint, and is strong and bold in spike and habit. The collection at Holloway therefore is full of interest, albeit the varieties are not novel. The most desirable of the white-flowered ones represented there were *Mont Blanc*, *Baroness van Tuyl*, *Ja Grandesse*, and *Alba maxima*; *Grandeur à Merveille* is white also, but for the faintest blush, and is very good. In blues and purples there are many excellent kinds, but of the paler shades, the best one is *Czar Peter*, very like to *Lord Derby*, the individual flowers being larger, but with more substance, and the bloom is of a more delicate tint. On the other hand, *Lord Derby* usually produces a finer spike of flower; *Grand Maître* is a good bright blue-flowered one, and darker shades are afforded by *Sir H. Berkley*, the very well known *Chas. Dickens*, *King of the Blues*, and *King of the Blacks*. Hyacinths afford us many shades in rose, including *carmine*, *salmon*, and *pink*. *Von Schiller*, *Roi des Belges*, *Rubra maxima*, *Koh-i-noor*, *Gertrude*, *Macaulay*, and *Princess Helena*, represent some of the best in this section; then there are *Fabiola*, *salmon pink*; *Solfaterre*, *cerise*; *Marchioness of Lorne*, *salmon*; and *Obelisque*, which is almost citron-coloured. None of these are second-class varieties, and all were noticed in very good condition. Tulips had also made a good display, but were past their best at the time of our visit. In bloom were *Dussart*, *crimson*; *Standard Royal*, white with crimson stripe; *Prince of Austria*, orange-red; *Proserpine*, rose; *Van der Neer*, clear violet; *La Belle Alliance*, *Joost Van Vondel*, in two varieties, one rosy crimson, the other pure white; *Keizerskroon*, crimson scarlet; and the exquisitely pretty *Yellow Prince*. All of the foregoing are early single-flowered kinds; but good double-flowered sorts were present in *Murillo*, pale rose and white, and *Velvet Gem*, dark carmine, edged with pale yellow. In another house there was a very fine show of *Civeias* in flower. *C. miniata*, and numerous varieties, such as *General Gordon*, *Van Houtte*, *Meteor* (very good), *Splendens*, *aurantiaca*, *cruenta*, *Lindeni*, and *Ambroise Verschaffelte*. The last named is still one of the best, both it and *Aurantiaca* bore excellent trusses of good flowers.

In the *Hippeastrum*-house the plants are fast developing their flower-spikes, and in the course of a week or so should furnish an abundance of flowers.

In the *Orchid*-houses the plants exhibited a healthy appearance, and are in many cases showing unmistakable signs of blooming during the forthcoming weeks. In bloom at the moment were *Odontoglossum Edwardi*, which bore a very fine spike of flowers. *Zygopetalum crinitum* *ceruleum*, many varieties of *Dendrobium Wardianum*, likewise *D. nobile* and *D. n. nobilium*. There were *Cypripedium Harryanum*, and a few other varieties, also the very pretty pure white-flowered *Angreecum modestum*, &c. The plants are not likely to suffer from the flowers remaining too long on the plants, for since Messrs. Williams have commenced a high-class florist's business in *Piccadilly*, in addition to the considerable work of the same character that has always been done at *Holloway*, the *Orchid* blooms, like all others of a choice nature, are very much in request.

In the propagating-houses was a nice collection of young plants of a decorative character, these including a number of ornamental *Draecenas* of a saleable size, and a house full of young, well-grown *Crotons*. Palms were present in quantity; and such useful and graceful plants as the fine-leaved *Aralias*, *Caladiums*, *Acacias*, *Boronias*, &c., were in good-health condition. The general nursery stock, beside including most of the gems and novelties among house-plants, embraces an excellent assortment of the better known kinds, having ornamental foliage. There are numbers of climbing plants, too, of a good size, suitable for clothing the pillars, or walls, or roofs, of hot, intermediate, or cool-houses.

**A MISSING LINK.**—M. Dubois has discovered in tertiary strata in Java some fossil remains of an animal which, so far as appearances go, must have been intermediate between an anthropoid ape and a human being.

## MOWING-MACHINES, ETC., DRIVEN BY STEAM AND ELECTRICITY.

THE application of steam, raised by the combustion of oil or coal, has been frequently mooted in gardening papers, and only as recently as January 11, 18, and 25, and February 1, of the present year, the matter was revived in these pages by various writers, some opposing the idea of mechanical motors on æsthetic grounds, whilst others welcomed their advent as tending to lessen the gardeners' labours. The electrically-driven mower and roller, where an electric plant already exists, seems to us to offer the best form of machine, as no smoke is emitted, and no skilled workman is required to attend to it.

We give two illustrations of these machines (figs. 57 and 58). The electrical motor shown on p. 401 is of three-quarter-brake horse-power, and can be supplied to suit any existing electrical installation. This machine is made in various sizes. In the smallest machine the width of the rollers is 2½ feet, and the diameter 2 feet. The weight can be varied at pleasure, from 12 cwt. to 20 cwt.; and the rate at which it travels is 2 miles per hour. The other illustration shows a mower-roller driven by steam. The motor can be readily detached from the mower, and employed for rolling roads and walks, pumping, chaff-cutting, or any other purpose for which power is required. The inventor of the machines we figure is Mr. W. J. Stephenson-Peach, M.I.M.E., of Askew Hill, Burton-on-Trent, Professor of Engineering to Repton School and Cheltenham College.

## SOCIETIES.

### ROYAL HORTICULTURAL.

MARCH 21.—Though the exhibits at the meeting held on Tuesday last in the Drill Hall, James Street, Westminster, were fewer than on the preceding occasion, there were quite sufficient to constitute a good and interesting show. *Orchids* were numerous and good, and such plants as *Hippeastrums*, *Cyclamens*, *Cinerarias*, *Narcissus*, and miscellaneous hardy plants were exhibited in satisfactory quantities, and included a number of novelties. The exhibition of fruit amounted only to a very few specimens of seedling and other Apples, none of which were the recipients of awards. There was however a meritorious collection of Salads before the Fruit Committee.

### Floral Committee.

Present: W. MARSHALL, Esq., in the Chair, and Messrs. Jno. Fraser, Jno. Laing, H. B. May, H. Herbst, Chas. T. Drury, R. Dean, Henry Cannell, Jas. Hindson, J. F. McLeod, C. J. Salter, W. Bain, J. D. Pawle, C. E. Shea, H. J. Jones, Edwin Beckett, Thos. Peed, Jas. Walker, H. Turner, S. A. de Graaff, Geo. Paul, Geo. Gordon, Jno. Jennings, J. Fraser, and Chas. Jeffries.

W. STACEY, Esq., Drayton House, West Drayton (gr. Mr. John Wiggins) staged a collection of *Cyclamens*, which, coming from an amateur's garden, was deserving of very great commendation (Bronze Banksian Medal).

A collection of first class *Cyclamens* was shown also by the ST. GEORGE'S NURSERY CO., Hanwell (Silver Flora Medal).

Messrs. J. LAING & SONS, Forest Hill, London, S.E., had *Streptocarpus giganteus* in purple and pale blue varieties, also a fine large-leaved *Caladium* C. E. Dable.

Mr W. BULL, 536, King's Road, Chelsea, had a group of *Clivia miniata* varieties.

Messrs. R. WALLACE & CO., Colchester, exhibited four pots of the pretty creamy white *Erythronium Hartwegii*, a potful of the yellow *Iris Orchidioides*, and also yellow *Fritillaria Pudica* (see fig. 59), which, though known for a long time in gardens, has been but little grown (First-class Certificate).

Messrs. PAUL & SON, The "Old" Nurseries, Chesham, exhibited a group of *Hippeastrums* in flower. Also very well berried plants of *Acuba japonica splendens*, and . . . *viridis* name. Some hardy plants in pots, including *Hepaticas* in variety, Mixed *Polyanthuses*, *Phloxes*, &c., were also from Messrs. PAUL (Bronze Banksian Medal).

Hardy plants in flower were shown by Mr. THOS. S. WARD, Hyde Farm Nurseries, Tottenham, & Messrs. BAKER & SON, King Street, Covent Garden. In the former collection, among a very representative number of species, the following were especially noticeable: *Orobis verus albus*, with pure white flowers the pretty yellow *Adonis vernalis*, *Muscari botryoides album*, *Anemone pulsatilla*, *A. apennina*, *A. nemorosa* sba, many pretty varieties of *Primulas* and *Fritillarias* (including *F. pudica*, a dwarf flowering yellow variety). (See fig. 59, p. 405). (First-class Certificate). *Hepaticas*, and a number of varieties of *Puffodils* in pots (Silver Flora Med.

Narcissus in many varieties constituted the major portion of Messrs BAIN'S exhibit. Several species of Tulip were in bloom, including *T. biflora* which produces several flowers of pale lemon colour or white on each spike, *T. undulatifolia*

A very fine display of Cineraris was made upon the floor of the Hall by Messrs. JAS. CURRIE & Co., 237, High Holborn, London. The plants, which were furnished with very fine foliage, were all seedlings, and they represented a very

Road, London, S. E. Messrs. CUTBUSH'S group was especially rich in such excellent hardwooded greenhouse plants as *Erica Wilmoreana*, *E. Cavendishii*, *E. persoluta alba*, *Boronia heterophylla*, *B. megastigma*, and *B. serrulata*, &c. Some fine varieties of *Souvenir de la Malmaison* Carnations in pots were included also, and other species of spring flowering plants (Silver Banksian Medal.) Messrs. PEED'S group owed its fine appearance to some well-grown *Caladiums* and high coloured *Dracaenas*, which were intermixed with a number of *Orchids* in flower and a few spring flowering plants from the forcing houses. (Silver Flora Medal.)

Zonal *Pelargoniums* looked wonderfully bright and gay as shown in sprays by Messrs. H. CANNELL & SOXS, Swanley, Kent. Three plants were also shown of *Bellis perennis*, "The Bride," figured in *Gard. Chron.*, August 3, 1895, p. 131. There were not many flowers yet developed, but quite sufficient to show what an excellent white flower for many purposes it will make, considering its simple cultural requirements. As shown, the stems are stout, about seven inches long, and the flower is large, double, and pure white. (Award of Merit.)

A number of plants of a coloured flowered Primrose, "Kentish Bedder" were exhibited by Messrs. CANNELL, and the large flowered violet "Princess of Wales." (See fig. 53, p. 395). (Bronze Banksian Medal.)

From Messrs. T. CRIPPS & SON, Tunbridge Wells, was shown a basket of plants of *Rose Crimson Rambler*. The plants were not more than eighteen inches high, but were covered with flowers. A fine plant of *Asparagus Sprengeri*, *Berberis Knightii*, and some plants of *Lycocostera formosa variegata*, together with half-a-dozen plants or so in fine flower of *Deutzia Lemoinei* (First Class Certificate.) For figure and description of this fine variety of *Deutzia*, see *Gardeners' Chronicle*, Oct. 5, 1895, p. 389.

Mrs. CRAWFORD, Gatton, Reigate (gr., Mr. Wm. Slogrove exhibited two seedling varieties of *Clivias*, and from Mr. Wm. BULL, King's Road, Chelsea, were two plants of *Nidularium Innocenti striatum*, a variety with creamy white stripes through the centre of the leaves.

Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, N., staged a group of *Clivias* in flower, also some plants of *Azalea mollis* and *sinensis* (Silver Banksian Medal.)

A large and capital group of *Calla Little Gem* was shown by Mr. E. BECKETT, Aldenham House Gardens, Elstree, Herts (Silver Banksian Medal.)

Cut *Camellia* blossoms in eighteen varieties were staged by H. W. ROWKAT, Esq., Whitford House, St. Margarets-on-Thames, and Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, showed a large number of *Cineraria* blossoms representative of their superb strain, and their Covent Garden strain.

Messrs. STROUD BROS., 182, Green Lanes, Finsbury Park, N. exhibited half a dozen plants of a *Pteris*, with very toothed ragged foliage, under the name of *P. Peculiar*.

*Anthurium Andreanum* var. *maximum* was shown by J. T. BENNETT-POE, Esq., Hohnwood, Cheshunt (gr., Mr. Downes) The spathe of this variety are very large.

Two seedling *Anthuriums* were shown from the gardens of Sir TREVOR LAWRENCE (gr., Mr. Bain). One of these *A. pumila* was very dwarf, being not more than 7 inches high. The foliage was strap-like and the form of the spathe almost round (Award of Merit). A *Rothschildianum maximum* was a very handsome plant with large mottled spathes, of a very decorative character (Award of Merit).

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, staged a group of exquisite *Hippas'rum* seedlings. To *Eros*, one of the lighter coloured flowers referred to in our columns last week, was recommended an Award of Merit. *Rosalind*, another of the same type, but with more green in the throat, and more colour in the petals, received a similar award. *Euterpe* was a self-coloured one of the brightest rosy crimson we have seen.

**Orchid Committee.**

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. J. O'Brien (Hon. Sec.), N. C. Cookson, De B. Crawshaw, F. Hardy, H. M. Pollett, H. Ballantine, W. H. White, J. Gabriel, W. H. Protheroe, H. J. Chapman, J. G. Fowler, T. W. Loud, E. Hill, J. Jaques, H. Williams, and F. Mason.

There was a very fine show of *Orchids*, among which the *Dendrobiums*, as is usual at this season, were prominent. One of the best representative groups of these plants was staged by F. HARDY, Esq., Tyntesfield, Ashton-on-Mersey gr., Mr. T. Stafford, in which some fine crosses and varieties of *Dendrobium* noble were excellent in regard to flowering and cultivation. Among them were a grand plant of *D. noble mobilis*, an equally good example of the fine white *D. n. Amesiae*, which was seen to advantage beside an example of the older *D. n. albiflorum*, and other forms of *D. noble*. There were also splendidly-flowered examples of *D. x Leechianum*, *D. x Leechianum album*, and smaller ones of the new *D. x Holmesianum* (*Dominianum x Schneiderianum* x); *D. x Cybele*, *D. x Apollo*, and a noble specimen of *D. x Schneiderianum*, for which a Cultural Commendation was awarded.
